I. INTRODUCTION

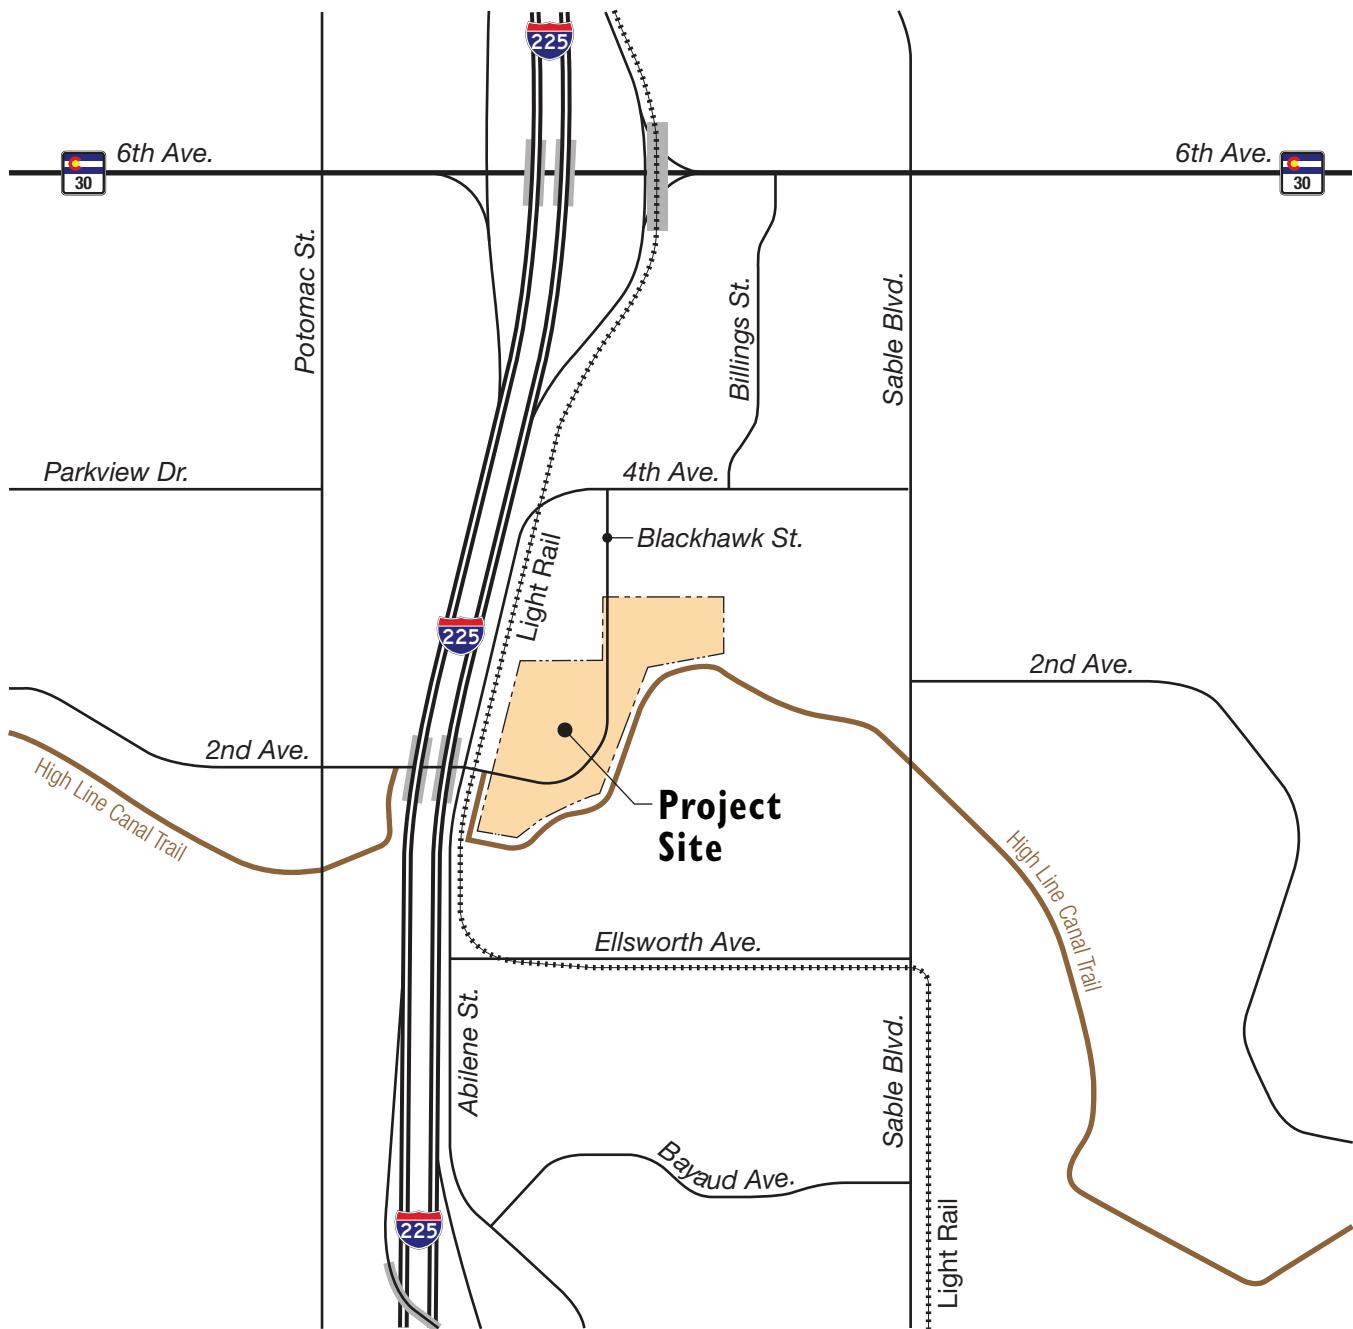

The Abilene Station Transit-Oriented Development (TOD) is a proposed 8-acre development located on the east side of I-225 in the city of Aurora, Colorado. Specifically, the site is located on the northeast corner of 2nd Avenue and Abilene Street as shown on **Figure 1**. The development is planned for multifamily residential and retail uses as part of a TOD. Access to the development is planned to be provided via Blackhawk Street to 4th Avenue (which Cambridge College currently uses) and 2nd Avenue onto Abilene Street. **Figure 2** shows the Site Plan.

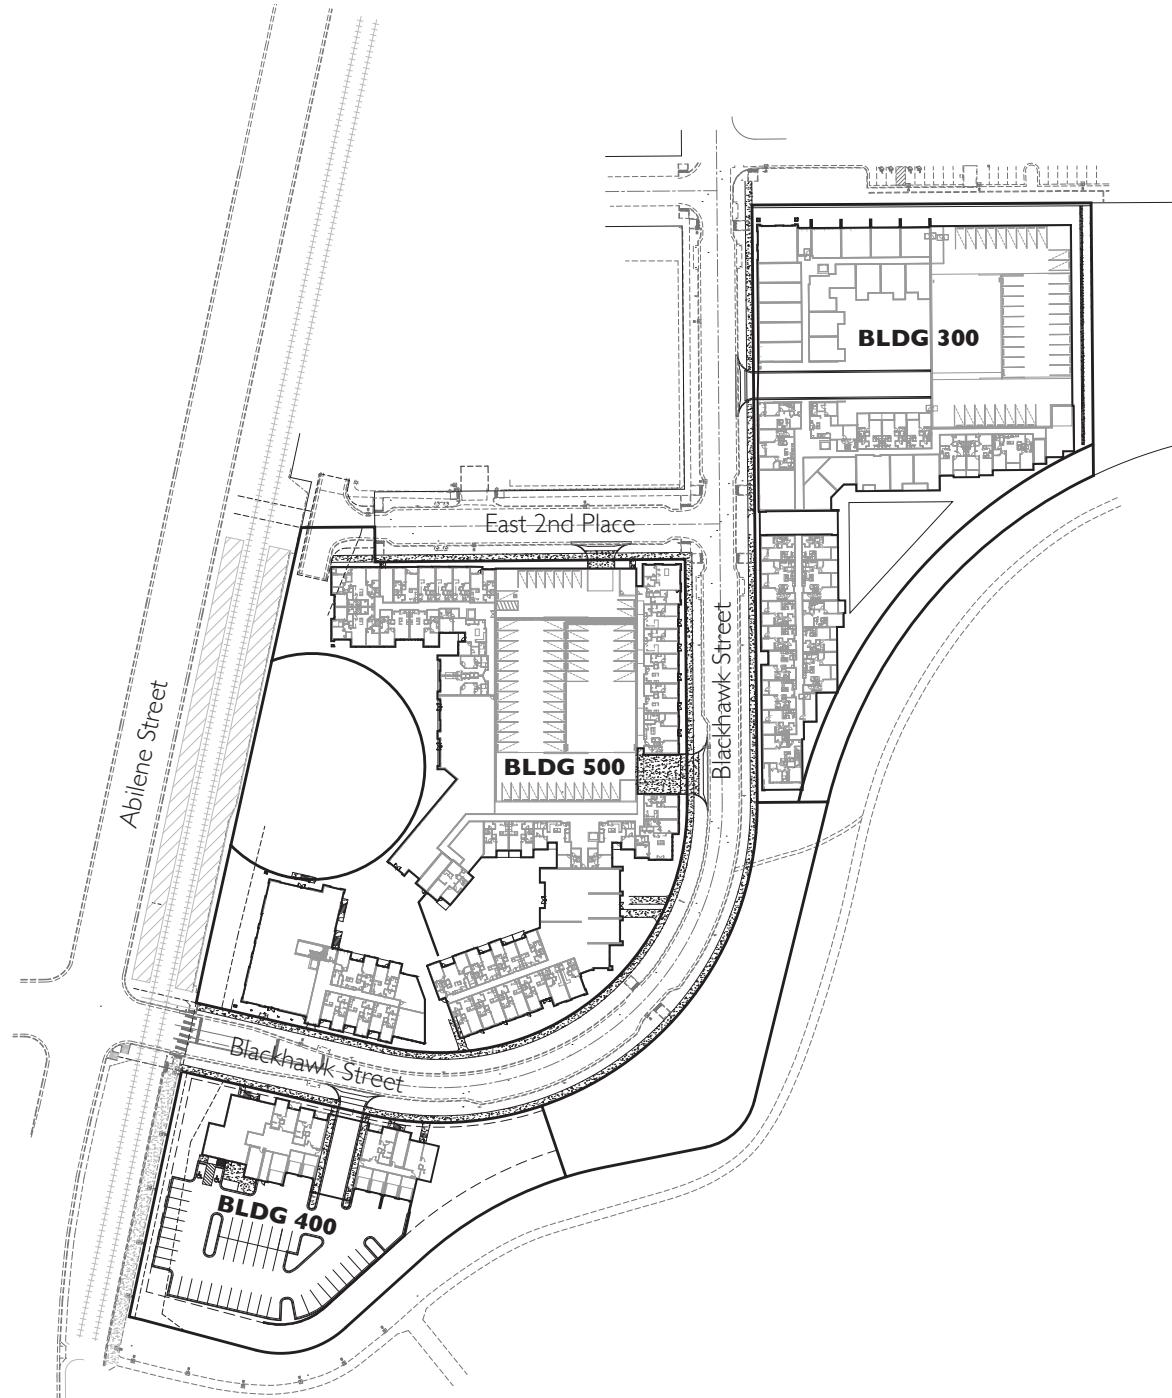

Light rail currently serves the site with a station located immediately adjacent. This development is designed to take advantage of this infrastructure, likely resulting in reduced trip generation potential due to the station's proximity.

This report was prepared to address the potential traffic impact on the adjacent roadways due to traffic generated by this proposed development and to identify the need for the appropriate traffic and roadway control improvements. In addition, traffic calming options along Blackhawk Street through the site are assessed, and a pedestrian accommodation assessment of Blackhawk Street is also provided.

This analysis considered two possible future scenarios:

- **Short-Range Future:** This scenario focuses on the traffic impact at the planned buildout of the site for the year 2025.
- **Long-Range Future:** This scenario analyses the traffic impact of the proposed site for the year 2045.

ULLEVIG

NOTE: Drawing Not to Scale

II. EXISTING CONDITIONS

II.A. Land Use

The site is currently undeveloped. Residential uses exist to the east and south (across the Highline Canal) of the proposed development. Cambridge College, located to the development's northeast, currently uses Blackhawk Street for access, and the Courtyard by Marriott is north of the proposed site. Other commercial development exists north of 4th Avenue, and I-225 is located west of the development (across Abilene Street and across the light rail line).

II.B. Roadway Network

Nearby roadways that could be most impacted by this development are described as follows:

- **Abilene Street:** This two-lane collector street is located along the site's west side. It has a 50-foot-wide pavement and is striped for two through lanes of traffic. To the south, Abilene serves a bit of a frontage road role serving retail and restaurant uses as far south as Iliff Avenue. North of 2nd Avenue, this road turns east into 4th Avenue at the north end of the development.
- **4th Avenue:** This two-lane minor arterial along the site's north side extends from Abilene Street to Sable Boulevard. Its current width is 68 feet, having been built to the older minor-arterial standards, and the road is striped to accommodate two lanes of traffic. While the width is more consistent with a minor arterial cross-section, the roadway's "role" is more in line with a collector classification with on-street parking.
- **2nd Avenue:** This roadway is grade-separated with I-225 located equidistant from 6th Avenue and Alameda Avenue interchanges. It crosses under the freeway and connects with Potomac Street. The road is 50 feet in width and provides two through lanes and bike lanes. 2nd Avenue crosses the light-rail line at grade just west of Abilene Street, where railroad crossing gates have been installed.
- **Blackhawk Street:** This short local road extends into the site from 4th Avenue along the western frontage of Cambridge College. The road extends south and curves into Abilene Street opposite 2nd Avenue.
- **Potomac Street:** This north-south roadway provides four through lanes as an arterial road extending north from 2nd Avenue to Colfax Avenue, where it is renamed Fitzsimons Parkway and continues north and west tying into MLK Boulevard at Peoria Street. To the south, Potomac Street extends to Alameda Parkway as a four-lane arterial, transitioning to a two-lane collector road through the residential area and eventually through the Aurora Medical Center campus area south of Mississippi Avenue. Its intersection with 2nd Avenue is signalized.
- **Sable Boulevard:** This north-south roadway provides four through lanes as a minor arterial road extending north to 6th Avenue where it "jogs" to the east and becomes a two-lane collector road through a residential area up to and beyond Colfax Avenue. To the south, Sable Boulevard continues as a four-lane minor arterial as far south as Mississippi Avenue, where it transitions to a two-lane collector passing through primarily residential development down to Iliff Avenue.

II.C. Traffic Volumes

Recent AM and PM peak hour turning movement data were collected at the intersections of Abilene Street with 2nd Avenue and E 4th Avenue with Blackhawk Street, as shown on **Figure 3**. Turning movement counts are included in **Appendix A**.

The immediate surrounding area roadways do not carry much traffic. From the turning movement counts, Abilene Street is estimated to carry approximately 7,400 vehicles per day (vpd) south of 2nd Avenue. 2nd Avenue is anticipated to carry about 8,600 vpd and 4th Avenue is estimated to have about 5,100 vpd.

The predominant traffic pattern adjacent to the site entails the interaction of trips between 2nd Avenue (under I-225) and the south leg of Abilene Street. Approximately 60 percent of the peak hour traffic passing through this intersection consists of movements between the south and west legs. Blackhawk Street, which runs through the site, serves approximately 50 vehicles per hour at its south end and approximately 180 vehicles per hour at its north end onto 4th Avenue. The existing Courtyard by Marriot, as well as the Academy of Advance Learning, generates most of the traffic using this road today.

The traffic levels along Sable Boulevard and along Potomac Street are noticeably greater than those along the road adjacent to the site. The peak hour turning movement counts at Potomac Street/2nd Avenue show a PM peak hour demand of approximately 1,700 vehicles per hour (both directions combined) along Potomac Street north of 2nd Avenue. The north-south through traffic is the predominant pattern through this intersection, but a rival pattern is the interaction of trips between the north and east legs of that intersection.

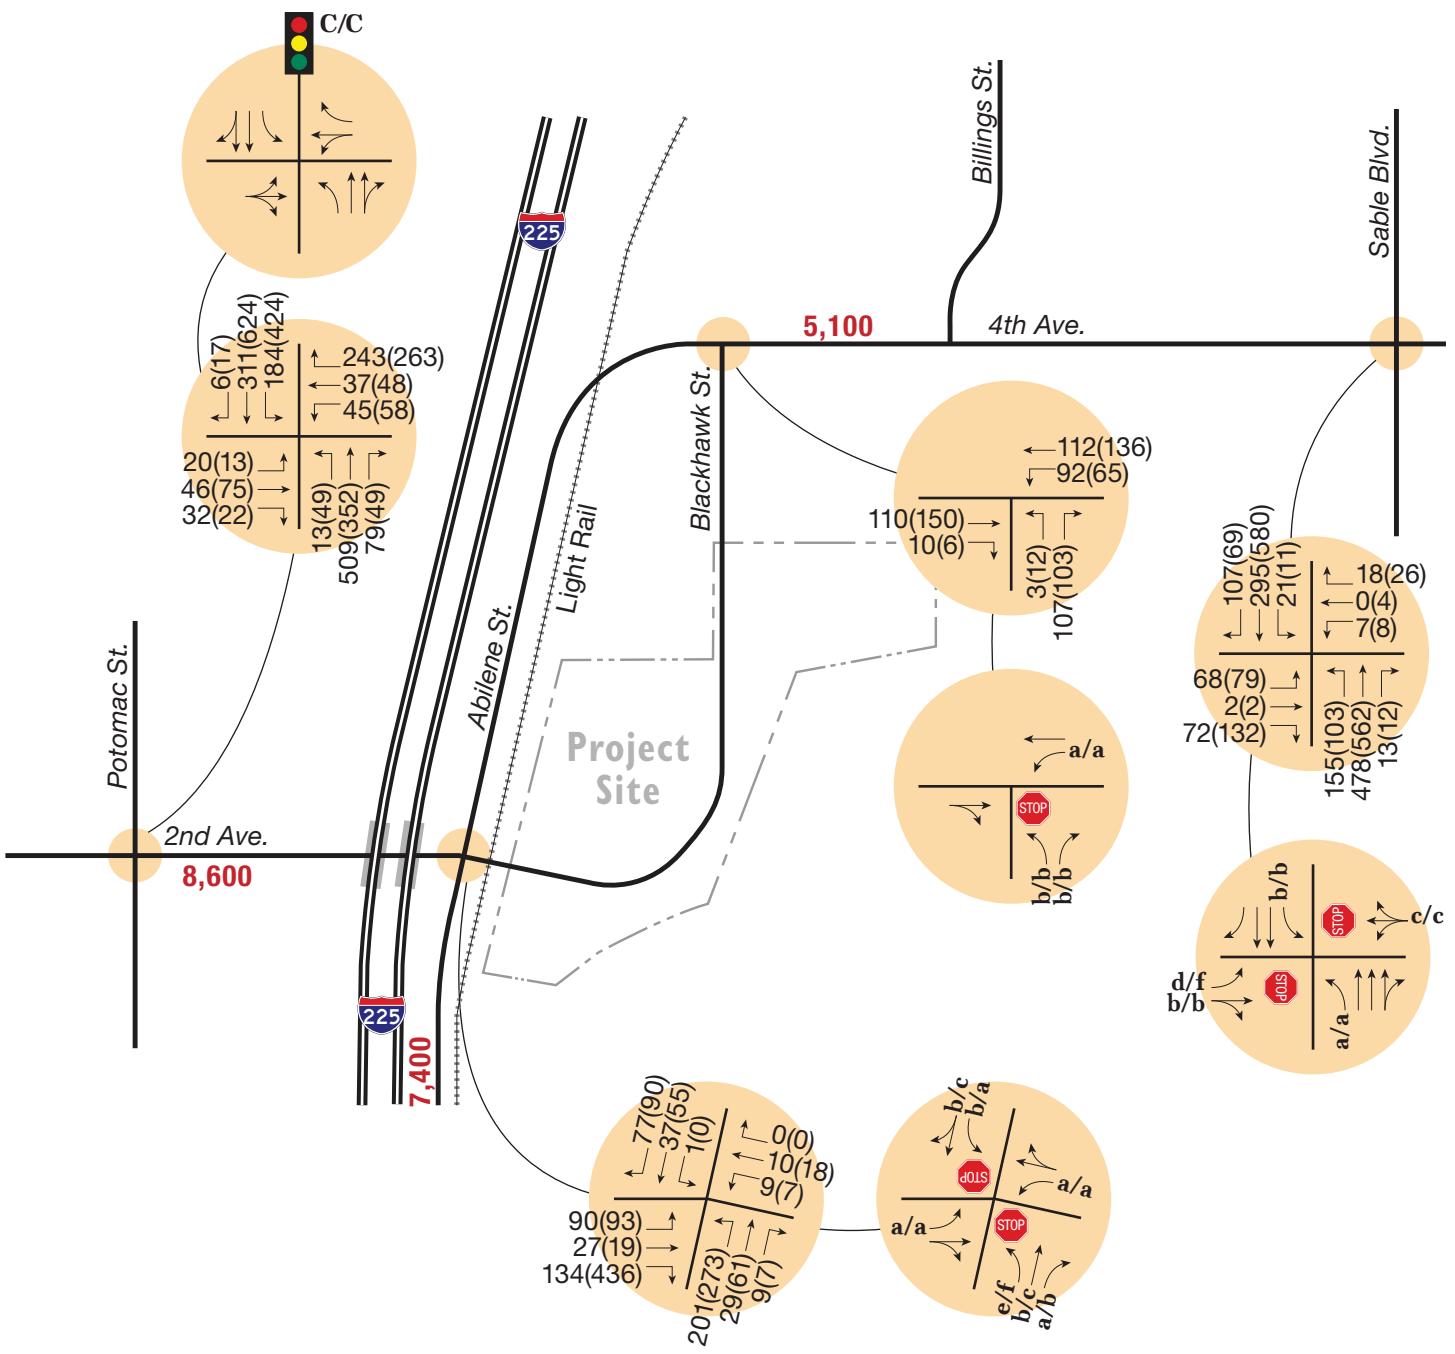

Sable Boulevard serves a PM peak hour traffic demand of approximately 1,400 vehicles per hour (both directions combined) south of 4th Avenue. The most significant pattern passing through this intersection is north-south through traffic.

II.D. Traffic Operations

Intersection Levels of Service (LOS) were calculated for the two study intersections. LOS is a qualitative assessment of the traffic flow characteristics described by a letter designation ranging from "A" to "F." LOS A represents traffic conditions with essentially uninterrupted flow and minimal delay, whereas LOS F represents the breakdown of traffic flow with excessive congestion and delay. Unsignalized intersection analyses result in a LOS designation for each non-free-flow intersection movement, whereas an overall LOS is reported for signalized intersections. LOS is technically defined by driver delay in seconds per vehicle, and a table that defines each LOS range and the LOS worksheets are contained in **Appendix B**.

Figure 3 shows that all movements operate at LOS C or better with the exception of the northbound left turn at the intersection of Abilene Street/2nd Avenue, which is anticipated to operate at LOS E in the AM and LOS F in the PM peak hour. This left turn movement represents the major traffic pattern passing through the intersection, and subjecting it to a stop produces long delays at peak hours. The stop-sign orientation at this intersection has been established as a result of the light-rail line passing across the east leg of the intersection.

The Potomac Street/2nd Avenue intersection is signalized, and overall operations show a LOS no worse than LOS C today during peak hours. The Sable Boulevard/4th Avenue intersection is side-street-stop controlled. The minor street left turn movement (eastbound to northbound left turn) operates the poorest at a LOS F during the PM peak hour. Side-street minor-left turn delay is common during peak hour where the main roadway is relatively busy.

- = Stop Sign

III. PROPOSED DEVELOPMENT

III.A. Site Access

Access to the site will be provided entirely by Blackhawk Street, which, in turn, connects to 4th Avenue north of the site and to Abilene Street at the south end of the site. A total of four access points are proposed onto 2nd Avenue/Blackhawk Street serving the development along both sides of the roadway. One access, located just north of the curve and entering 2nd Avenue/Blackhawk Street from the west, will be limited to three-quarter movement. The left out from this access will be prohibited due to driver sight distance limitation along the curvature of the roadway.

III.B. Land Use

The proposed development would include a total of 582 multifamily residential units and 10,000 square feet of retail space. For purposes of this report, it was assumed full buildout of the proposed redevelopment would occur by year 2025.

III.C. Trip Generation

The number of vehicle trips generated by the proposed development was estimated based on the generation equations documented in *Trip Generation Manual*, by the Institute of Transportation Engineers (ITE), 10th Edition, 2017, as shown in **Table 1**.

Table 1. Trip Generation Equations

Land Use	Daily	AM	PM	Distribution
Multifamily (Mid-rise)	$T=5.45*x-1.75$	$\ln(T)=0.98*\ln(x)-0.98$	$\ln(T)=0.96*\ln(x)-0.63$	AM: 26% in/74% out PM: 61% in/39% out
Commercial	$\ln(T)=0.68*\ln(x)+5.57$	$T=0.5*x+151.78$	$\ln(T)=0.74*\ln(x)+2.89$	AM: 62% in/38% out PM: 48% in/52% out

These trip generation equations were compared with the 11th Edition of the *Trip Generation Manual* and were found to be slightly higher creating a more conservative approach. **Table 2** presents the estimated daily and peak hour vehicle-trips generated by the proposed development. Because this is a TOD and mixed uses are proposed, a 15 percent reduction was applied “across the board” to the trip estimates. The ITE *Trip Generation Handbook* showed a range of rates from 15 to 20 percent for existing sites with similar light-rail proximity; therefore, a conservative assumption of 15 percent was used.

Table 2. Estimated Trip Generation

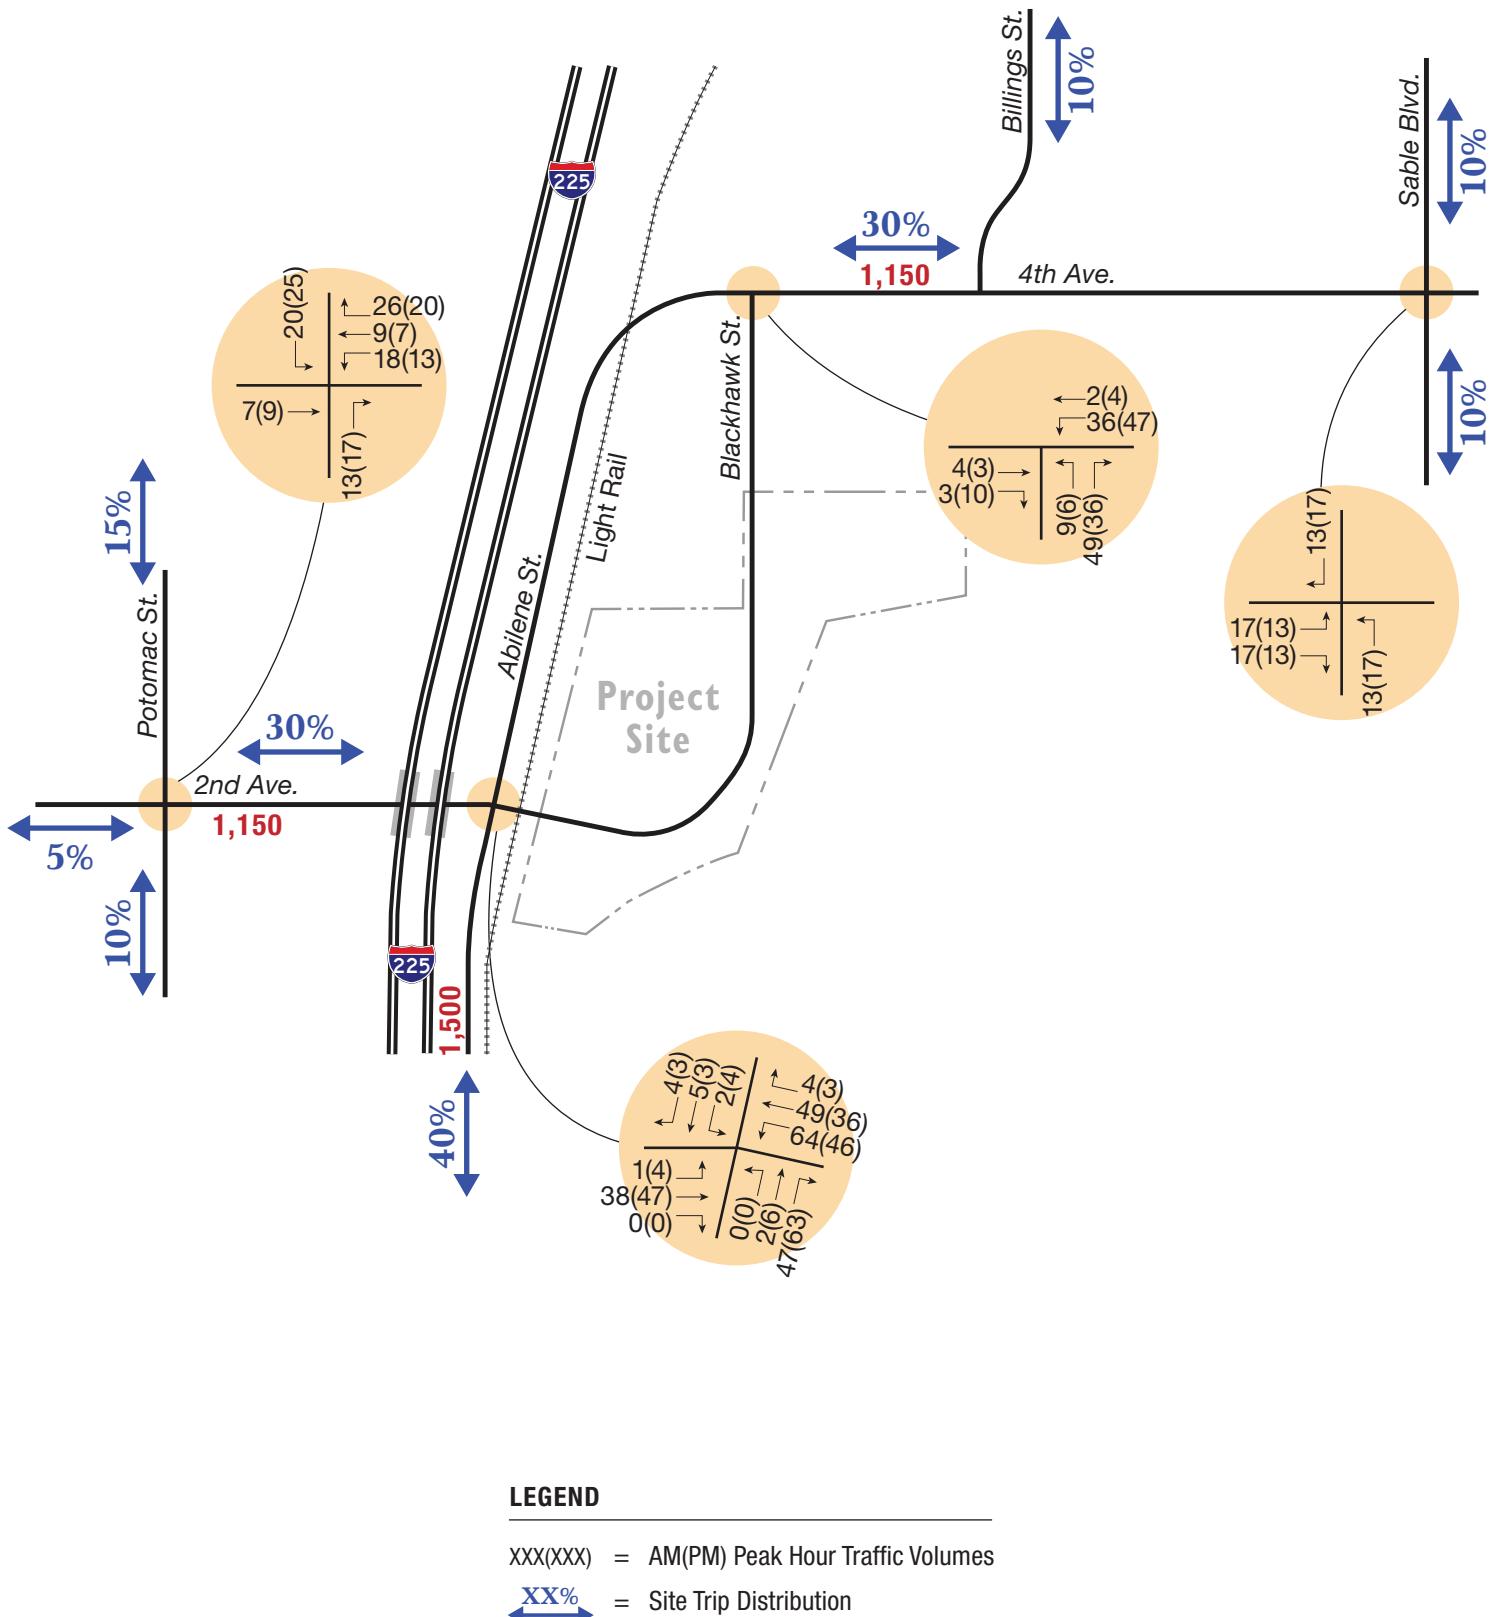

Building #	Land Use	ITE Code	Unit	Quantity	Daily	AM Peak			PM Peak			
						In	Out	Total	In	Out	Total	
300	Multifamily (Mid-rise)	221	DU	204	1,111	18	51	69	54	34	88	
400	Multifamily (Mid-rise)	221	DU	78	424	7	20	27	21	14	35	
500	Multifamily (Mid-rise)	221	DU	300	1,634	26	75	101	78	50	128	
	Commercial	820	KSF	10	1,257	97	60	157	48	51	99	
Building 5 Total						2,891	123	135	258	126	101	227
Grand Total						4,426	148	206	354	201	149	350
15% Alternative Mode and Internal Trip Reduction						664	22	31	53	30	22	53
Total External Trips						3,762	126	175	301	171	127	297

As shown in **Table 2**, the development is expected to generate approximately 3,760 vehicle-trips per day, with approximately 300 vehicle-trips during the AM and PM peak hours.

III.D. Site Generated Traffic

The site trip distribution estimates, shown on **Figure 4**, are based on the accessibility to major roadways, the development's location relative to other major areas, and existing traffic patterns. The largest component of traffic is estimated to be oriented to/from the south along Abilene Street. The following distribution percentages were used to assign the vehicle trips to the roadway network for both the Short-Range and Long-Range Future:

- 40 percent oriented to/from the south on Abilene Street
- 30 percent oriented to/from the east on the 4th Avenue (in which 10 percent is oriented north along Billings Street, 10 percent north along Sable Boulevard, and 10 percent south along Sable Boulevard).
- 30 percent oriented to/from the west on the 2nd Avenue (in which 15 percent is oriented north along Potomac Street, 5 percent west along 2nd Avenue, and 10 percent south along Potomac Street).

IV. BACKGROUND TRAFFIC CONDITIONS

Background traffic is defined as that element of traffic volume making use of the surrounding roadway system that is not associated with the proposed site development.

IV.A. Traffic Control

The intersection of 2nd Avenue with Abilene Street is anticipated to meet signal warrant criteria in both the Short- and Long-Range total traffic scenarios (discussed in the next section). As such, this intersection was analyzed under signalized control for background traffic purposes, affording a fair comparison between LOS results. Even background conditions may warrant signalization anyway due to the proximity of light rail.

IV.B. Roadway Network

The fundamental roadway network will not change from existing conditions.

IV.C. Traffic Forecasts

The existing traffic volumes shown on **Figure 3** and the Year 2045 Denver Regional Council of Governments (DRCOG) Travel Demand Model were used as the basis for developing background traffic forecasts. The DRCOG model showed an average annual growth rate of about 3 percent on Abilene north of 2nd Avenue and along 4th Avenue. The model also showed a 1.5 percent annual growth rate on 2nd Avenue west of Abilene Street and along Abilene Street south of 2nd Avenue. Along Sable Boulevard and Potomac Street, the DRCOG model suggests an average of 2 percent annual growth. These growth rates were applied to the existing peak hour counts to develop future volume forecasts for both the Short- and Long-Range planning horizon years.

The 2045 timeframe also incorporated trips from potential future development located immediately north of the Courtyard by Marriott site. From a previous development proposal, up to 90 multifamily units could occur on that property, which was used to estimate additional 2045 background traffic.

IV.D. Traffic Operations

The following subsections describe the impacts future growth would have on traffic operations in the study area.

Short-Range Future (Year 2025)

Figure 5 illustrates the traffic forecasts, geometry, traffic control, and capacity analysis for the Short-Range future background condition, and **Appendix C** contains LOS worksheets. The Abilene Street/2nd Avenue intersection signalized analyses incorporated an exclusive phase for the light rail train passing through.

The unsignalized intersection movements will operate at LOS C or better in most cases; the eastbound left turn movement at 4th/Sable operates at LOS F. The overall LOS for signalized intersections will operate at LOS B or better. These operational results are subject to the implementation of a signal at the intersection of Abilene Street with 2nd Avenue. Signal warrant worksheets are contained in **Appendix D**.

Signal progression time-space diagrams along 2nd Avenue can be found in **Appendix E**. Diagrams are provided for the Short-Range and Long-Range total conditions. The major peak hour pattern through the two-signal system of 2nd Avenue/Potomac Street and 2nd Avenue/Abilene Street consists of trip interactions between Potomac Street north of 2nd Avenue and Abilene Street south of 2nd Avenue. The time space-diagrams show the potential coordination between the two intersections such that the southbound left turn movement from Potomac Street will arrive to Abilene Street during the green, and that the northbound left turn movement from Abilene Street will arrive to Potomac Street during its green. The darker shading shown on those diagrams is specific to those two movements.

The Sable Boulevard/4th Avenue intersection's minor approach movements will experience delay during peak hour, especially the eastbound left turn movement. A brief review of the MUTCD peak hour warrant to generally assess its potential for warranting signalization and the traffic forecasts suggest that the intersection would fall short of meeting the peak hour warrant. Therefore, it is assumed that this intersection would remain unsignalized in the Short-Range timeframe.

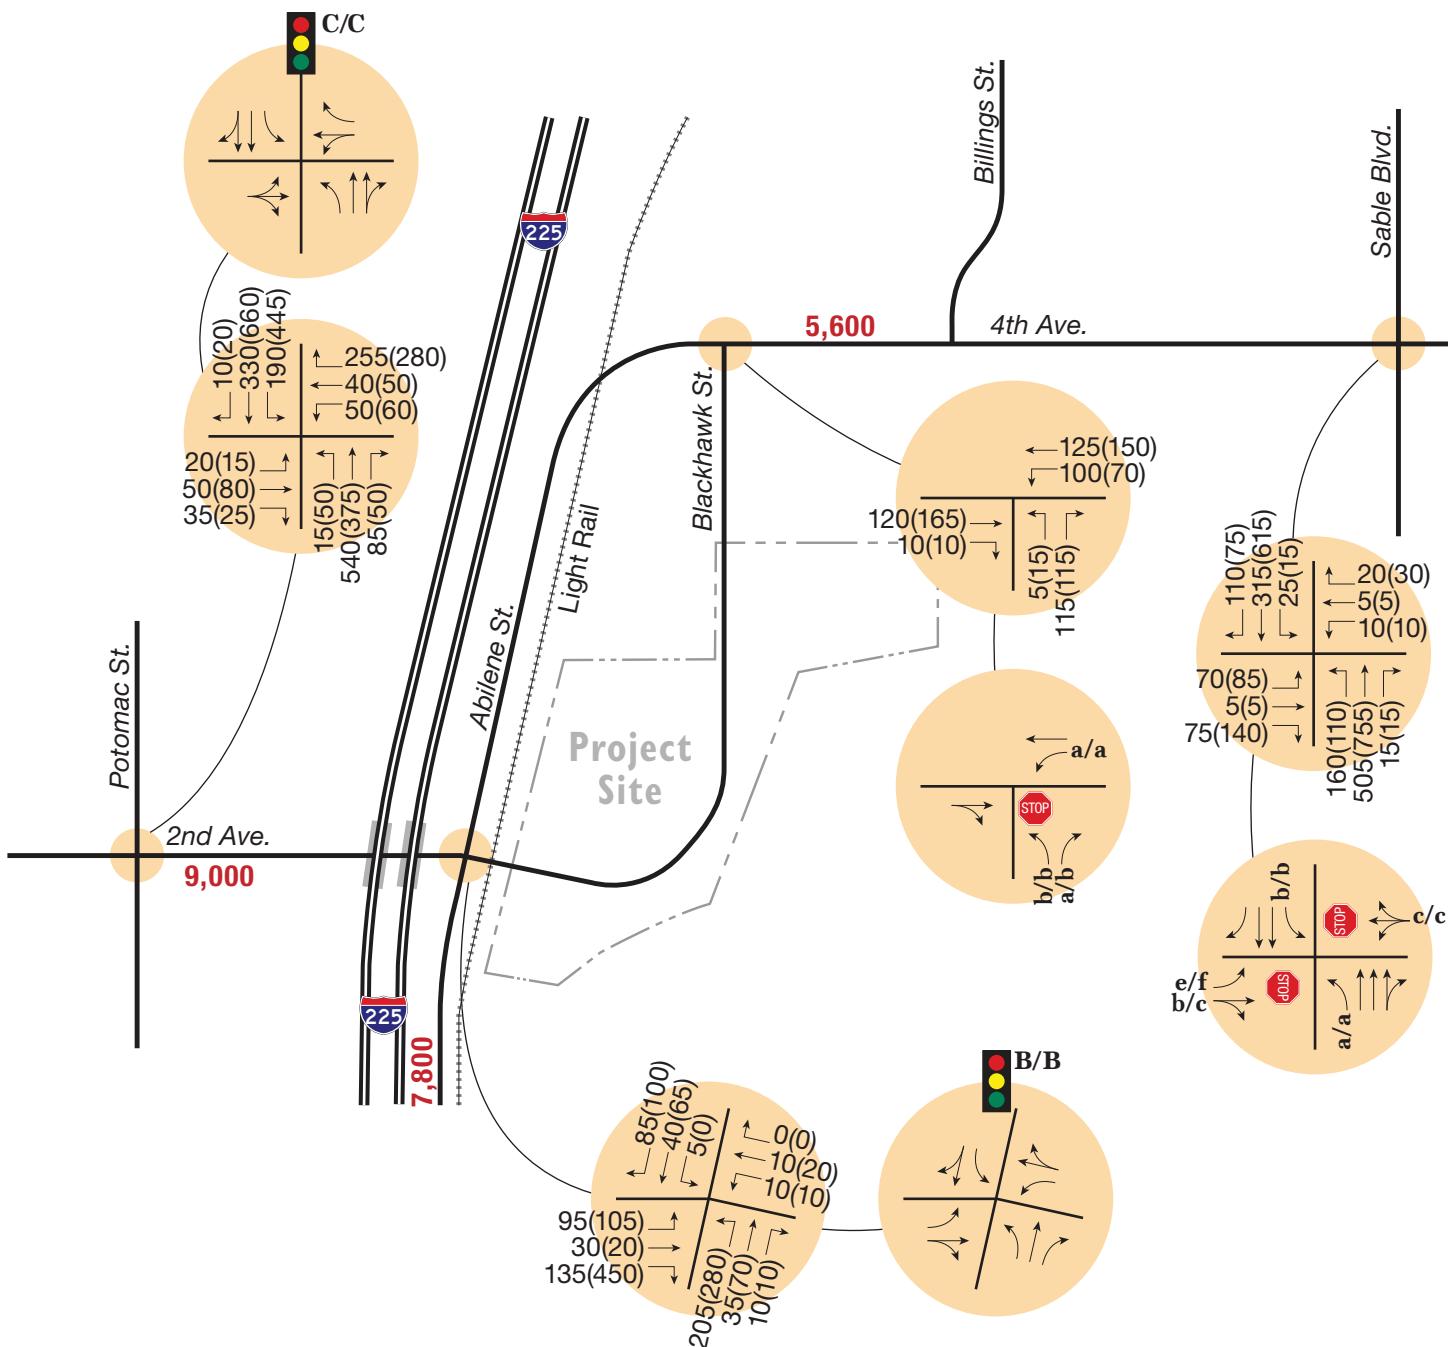

The Potomac Street/2nd Avenue, being signalized, will continue to function at LOS C during the peak hours.

Long-Range Future (Year 2045)

Figure 6 illustrates the traffic forecasts, geometry, traffic control, and capacity analyses for the Long-Range future background condition. Traffic demands are anticipated to increase along all study area roadways and intersections. Directly below I-225, 2nd Avenue is projected to serve 12,400 vpd of background traffic. 4th Avenue background traffic northeast of the site is projected to reach 10,400 vpd. Potomac Street and Sable Boulevard traffic is projected to reach 2,600 vehicles per hour and approximately 2,100 vehicles per hour, respectively.

Appendix C contains the total traffic LOS worksheets. All unsignalized movements are anticipated to operate at LOS C or better, and the signalized intersection is anticipated to operate at LOS C during both the AM and PM peak hours. These results are subject to the implementation of a signal at the intersection of Abilene Street with 2nd Avenue, with a phasing element to account for the light rail.

Sable Boulevard and 4th Avenue would warrant signalization by 2045 given background traffic. The LOS results under signalized control are LOS B for both peak hours given the 2045 background traffic projections. **Appendix D** shows signal warrant worksheets. Potomac Street and 2nd Avenue intersection will continue to function at a LOS C given the 2045 traffic projections.

FIGURE 6

Long-Range Background Traffic Conditions

V. TOTAL CONDITIONS

V.A. Traffic Volumes

Site-generated traffic volumes were added to the background traffic volumes for both future scenarios to calculate total traffic volumes. **Figure 7** presents the projected Short-Range future total traffic volumes, and **Figure 8** presents the projected Long-Range future total traffic volumes.

V.B. Traffic Control

No intersections are anticipated to require traffic control changes as a result of the development. With the notable increase that will occur on the east leg of that intersection and the at-grade light-rail crossing, signalization should be implemented for safety reasons. A properly configured signal will help prevent traffic queues from sitting on the rail line and prevent movements from turning onto the rail line when a train is approaching. One other variation in traffic control is at Sable Boulevard/4th Avenue with the addition of a traffic signal, but this is more due to regional growth in traffic rather than the Abilene Station development.

V.C. Traffic Operations

LOS analyses were conducted to compare the existing and projected background operational conditions to the anticipated LOS with the addition of site-generated traffic. The following subsections describe the impacts that the proposed redevelopment would have on traffic operations in the study area.

Short-Range Future (Year 2025)

Figure 7 illustrates geometry, traffic control, and capacity analysis for the Short-Range future total conditions, and **Appendix F** contains LOS worksheets.

As shown, the signalized intersections are anticipated to operate at LOS C or better during the AM and PM peak hours. The 4th Avenue/Sable Boulevard unsignalized minor approach eastbound left turn movement is projected to continue to operate at LOS F during the PM peak hour under the current side-street-stop control. Because warranting signalization will be borderline, **Figure 7** also presents the LOS results for signalized condition, which show an overall result of LOS B.

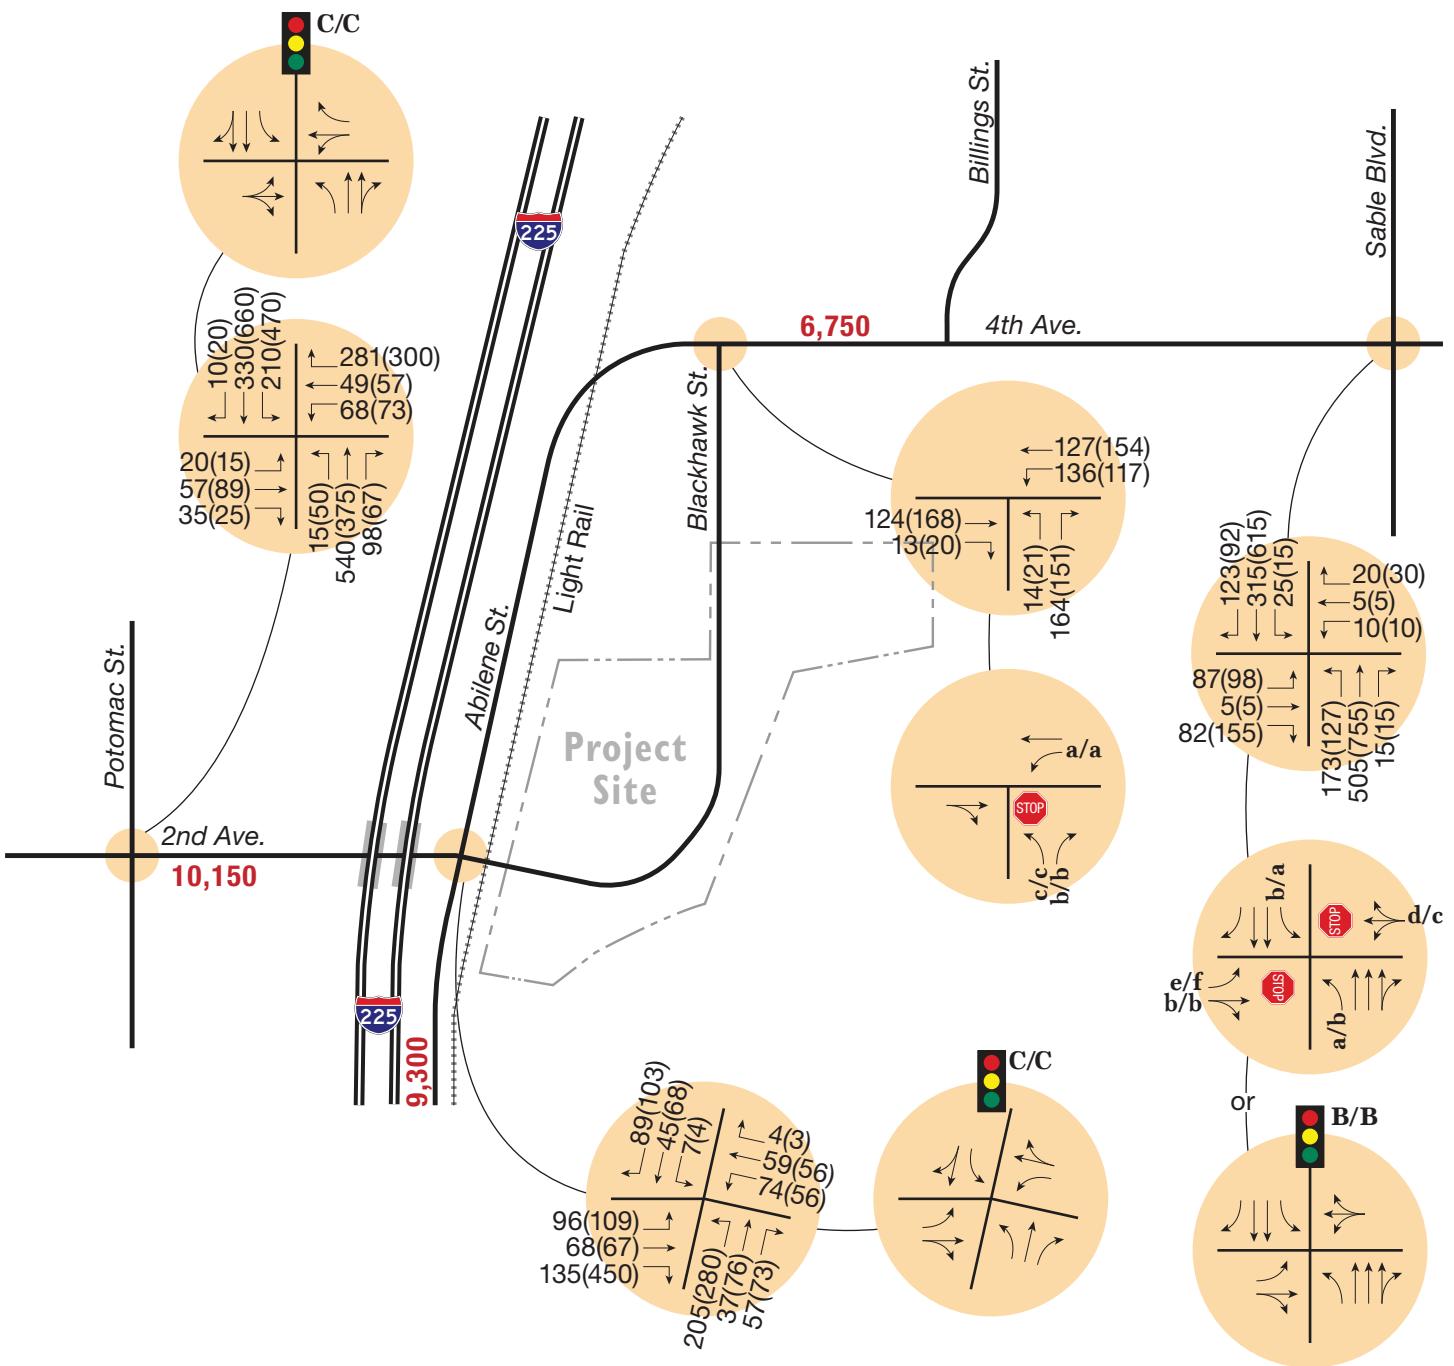

Long-Range Future (Year 2045)

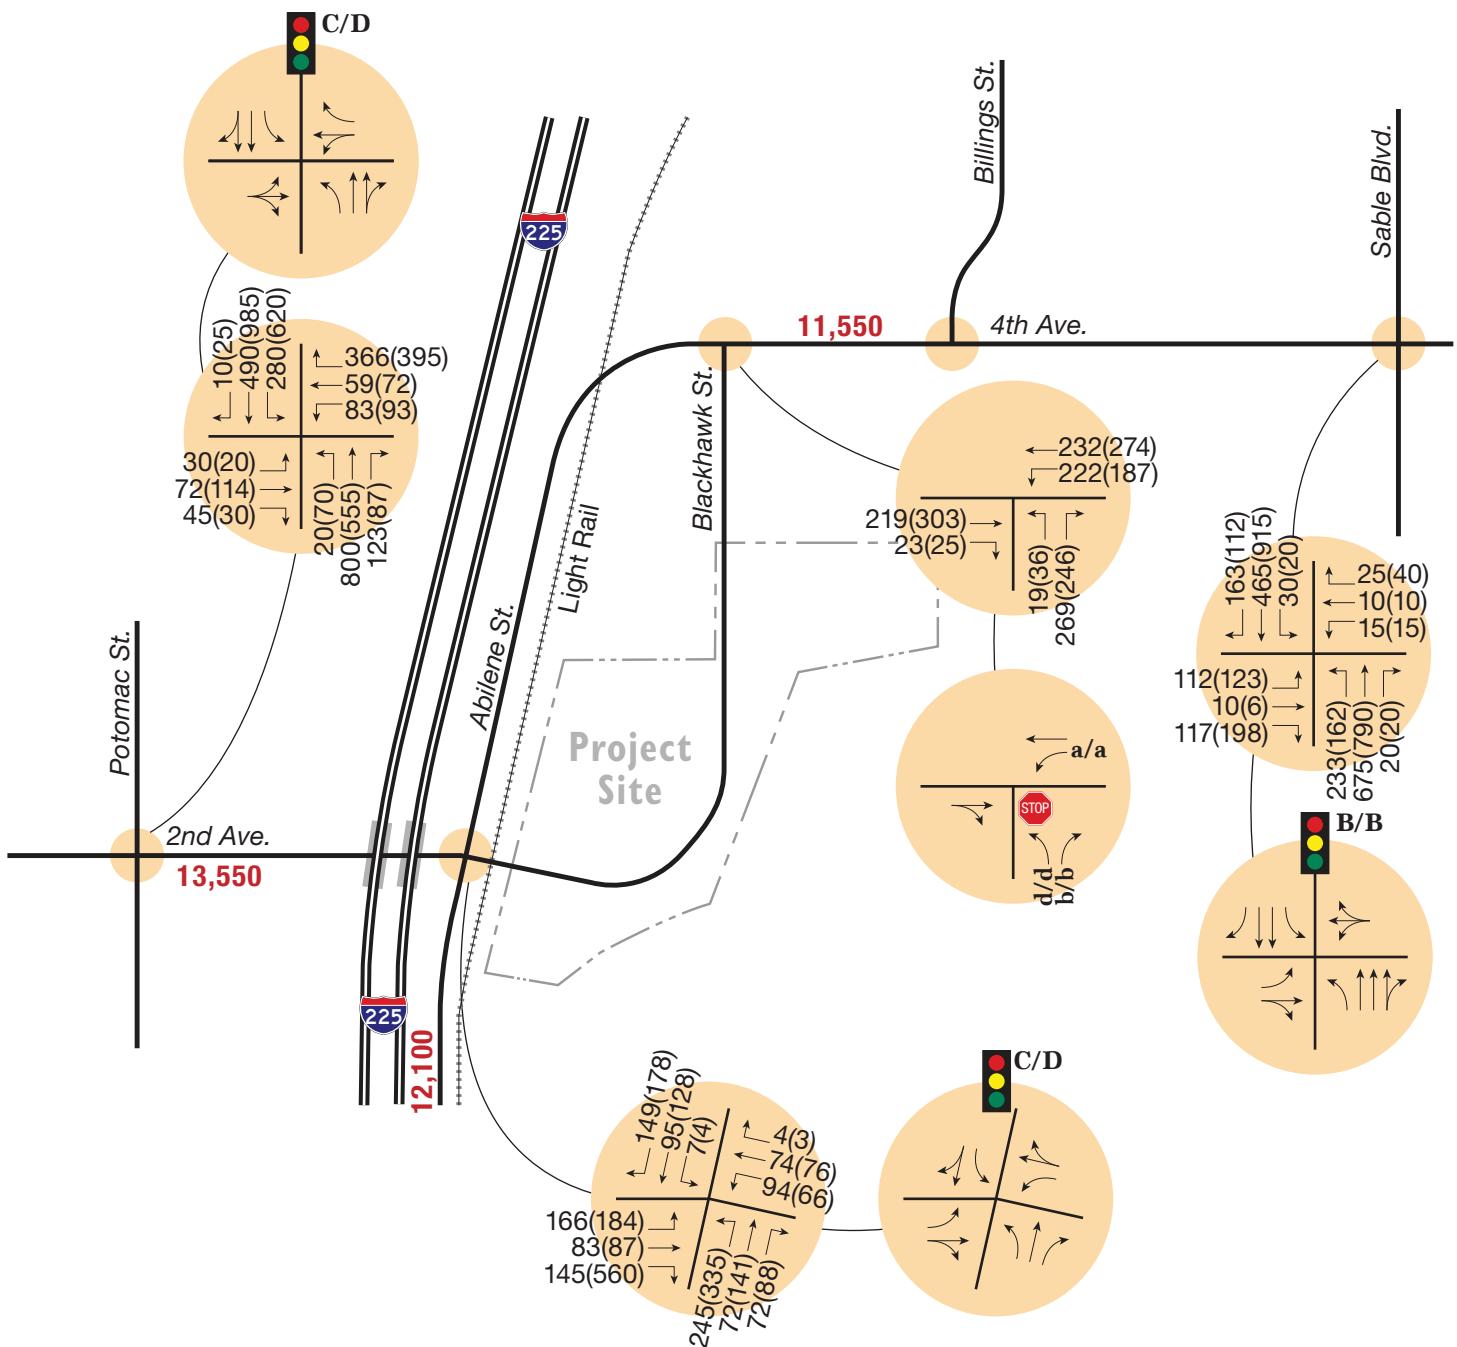

Operational analyses were conducted to quantify the impact of site traffic on Long-Range future total traffic operations at the study area intersections. **Figure 8** illustrates geometry, traffic control, and capacity analyses for the Long-Range future condition. **Appendix F** contains the total traffic LOS.

The signalized intersections are anticipated to operate at LOS C or better during the AM peak hour and LOS D or better during the PM peak hour, incorporating the effect of light rail. The site's traffic will make up approximately 13 to 21 percent of the total 2045 peak hour traffic passing through the Abilene Street/2nd Avenue intersection. All unsignalized movements will operate at LOS D or better.

The site's impact at the Potomac Street/2nd Avenue and Sable Boulevard/4th Avenue will be less on a percentage make-up standpoint. Given year 2045 traffic projections, the Abilene Station development would constitute 2.5 to 3.0 percent of the PM peak hour traffic passing through the Potomac Street/2nd intersection and passing through the Sable Boulevard/4th Avenue intersection.

Along Blackhawk Street within the development, detailed LOS calculations were not conducted. Daily traffic projections along this roadway are anticipated to be 3,000 to 4,000 vpd adjacent to the Abilene Station buildings, and two-lane collector roadway can accommodate 7,000 vpd. Given this and the level of traffic projected from each parcel along Blackhawk Street, access intersections should not experience any operational issues. Auxiliary lanes along Blackhawk Street will not be needed.

FIGURE 8

Long-Range Total Traffic Conditions

Queueing Analysis

Queuing at the study intersections was analyzed to recommend appropriate turn bay storage lengths. **Appendix G** contains a table outlining the existing storage length, 95th percentile storage length for each study scenario, recommended State Highway Access Code (SHAC) storage length, and overall recommended storage length for each turn bay.

Although the northbound left turn movement at the intersection of E 2nd Avenue with Abilene Street is anticipated to exceed the current provided storage length, this problem arises in background conditions and is more of a result of future growth in the area than it is the additional development. While the proposed Abilene Station development will not directly add traffic to the northbound left turn movement, this movement will be affected by the development's impact on other intersection movements. There is limited width between I-225 and the light-rail line to widen Abilene Street where additional length is needed; however, the current roadway has excess pavement width in the area and could provide up to a 2,400-foot left turn lane without widening (but with enhanced striping). The future extension of the westbound left turn lane at the intersection of 2nd Avenue with Abilene Street is anticipated to be required as a result of the expected development.

Also shown in **Appendix G** are significant queues for the westbound right turn movement at Potomac Street/2nd Avenue. The results shown in the table reflect a general signal phasing plan, and a right-turn overlap phase with the southbound left turn phase will aid this condition significantly. A sensitivity analysis suggests that the queues would be up to 40 to 50 percent less than that shown in **Appendix G**. Much of this projected condition is due to existing traffic and the regional growth that has been forecast.

A comprehensive reporting of the intersection LOS, including existing, Short-Range background, Short-Range total, Long-Range background, and Long-Range total, is provided in **Table 3**.

Table 3. Comprehensive LOS and Delay (seconds per vehicle) Results

VI. TRAFFIC CALMING

Due to the straight geometry of Blackhawk Street south of 4th Avenue, the city is concerned with possible speeding along this roadway, especially realizing that there will be pedestrian activity crossing the road. The development is planned to include curb extensions and on-street parking, both of which are known to decrease speeds on roadways. One other measure that should be considered in conjunction with this development is raised marked pedestrian crossings at those locations where pedestrians are being accommodated. This would facilitate safer crossings for pedestrians and slow drivers through this stretch of roadway, particularly at those locations.

VII. PEDESTRIAN ACCOMMODATIONS AND OPERATIONS

The city requested an analysis of pedestrian accommodation along Blackhawk Street. Pedestrian LOS measures have been developed as part of other city projections. However, these other analyses have been more focused on pedestrian LOS at intersections as opposed to along a corridor.

Consequently, other resources were researched. The *Boulder Low-Stress Walk and Bike Network Plan* outlines a Level of Traffic Stress (LTS) for pedestrians based on pedestrian and vehicle features along a roadway. The LTS of pedestrians is based on several factors, including the existence of a sidewalk and buffer, number of travel lanes, posted speed limit on the adjacent road, and existence of driveways along the roadway. The plan outlines four stress levels, with Level 1 cultivating the least amount of stress for pedestrians and Level 4 representing the most stressful conditions.

Blackhawk Street has, or will have, the following features relating to pedestrian stress:

1. The provision of sidewalks (some of which exist)
2. A sidewalk buffer of approximately 13.5 ft
3. 2 travel lanes
4. 25 mile per hour speed limit

Given the above features of the redeveloped Blackhawk Street, the roadway is estimated to have the lowest level of stress, LTS 1. LTS 1 is defined as highly comfortable and easily navigable for pedestrian users of all ages and abilities. **Figure 9** presents the pedestrian stress level analysis.

With respect to regional multimodal connectivity, several facilities will serve this development. Bike lanes exist along 2nd Avenue west of the site and along Abilene Street adjacent to the site. Future plans entail the eventual addition of bike lanes along 4th Avenue and extending east to Sable Boulevard. The Highline Canal Trail runs along the south end and part of the east side of the Abilene Station site. The trail is across the actual canal from the site, but a bridge spanning the canal exists about 300 feet east of Abilene Street. These existing and planned facilities are primarily intended to provide alternative mode connectivity to the light rail station, but these facilities will also serve future residents of Abilene Station.

Figure 9. Pedestrian Stress Level Analysis

Widths of Buffer	Input	Low-Stress		High-Stress	
		1	2	3	4
< 8 feet	Number of Travel Lanes	2 to 3 lanes	4 to 5 lanes	(no effect)	6+ lanes
	Posted Speed Limit	≤ 25 mph	30-35 mph	40-45 mph	≥ 50 mph
	Driveway Inventory	(no effect)	(no effect)	Curb cut intersects sidewalk	(no effect)
≥ 8 feet	Number of Travel Lanes	2 to 3 lanes	4+ lanes	(no effect)	(no effect)
	Posted Speed Limit	≤ 35 mph	≥ 40 mph	(no effect)	(no effect)
	Driveway Inventory	(no effect)	(no effect)	Curb cut intersects sidewalk	(no effect)

VIII. SUMMARY

The Abilene Station TOD entails developing approximately 8 acres of property on the east side of I-225 in the city of Aurora, Colorado, to include a total of 582 multifamily residential units and 10,000 square feet of retail space.

The mixed-use development is planned to be adjacent to an existing light-rail station, resulting in an estimated higher transit usage. Due to the proximity to the light-rail station, a 15 percent reduction was applied to the trip generation to account for transit usage and internal trips. At buildout, the development is projected to generate approximately 3,762 external trips per day.

The greatest traffic increase will occur onto Abilene Street with 1,500 vpd south of 2nd Avenue added by the site. An estimated 1,150 vpd will be added onto 2nd Avenue west of Abilene Street, as well as onto 4th Avenue east of Blackhawk Street with development of the site.

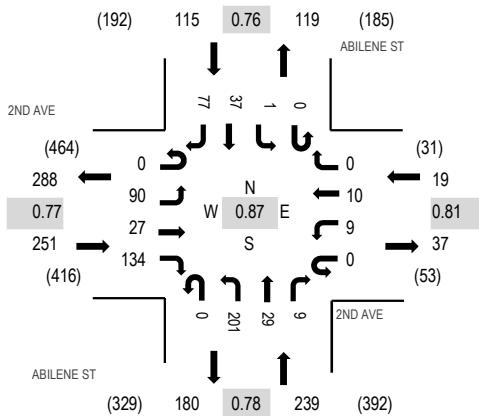

Other key findings and recommendations include:

- The intersection of Abilene Street with 2nd Avenue is anticipated to meet signal warrant criteria by the Short-Range background scenario based on projected volumes and proximity to the rail.
- The Abilene Street/2nd Avenue intersection will function acceptably during the AM peak hour at LOS C and LOS D during the PM peak hour for the Long-Range total scenario.
- The site's traffic will make up approximately 13 to 21 percent of the total 2045 peak hour traffic passing through the Abilene Street/2nd Avenue intersection.
- All unsignalized movements are anticipated to operate at LOS D or better at the adjacent site accesses. Because Short-Range conditions at Sable Boulevard/4th Avenue will not quite meet signal warrant criteria, the eastbound left turn movement will experience some delay during peak hours. However, the surrounding area has the option of using Billings Street to reach 6th Avenue; drivers have a reasonable option to making this left turn.
- The Potomac Street/2nd Avenue intersection will continue to operate acceptably given signalized control (which exists). No lane additions improvements are needed, and the development would constitute 2.5 to 3.0 percent of the total traffic projected to pass through this intersection in 2045. The southbound left turn lane should be lengthened to the extent possible via striping; a private access on the east side of Potomac Street will restrict limit the length of this southbound left turn lane.
- The Sable Boulevard/4th Avenue intersection will likely warrant signalization with regional growth. The Abilene Station development will incrementally add to this need representing 2.5 to 3.0 percent of the total 2045 peak hour traffic projected to use the intersection. Installation of a signal at this location is not critical in serving the Abilene Station development as much as it is in serving existing and area/regional traffic growth.
- Blackhawk Street will function adequately without the need for auxiliary turn lanes at the access points. The center access just north of the curve should be restricted to $\frac{3}{4}$ movement due to sight distance limitations.
- The development is anticipated to include on-street parking and curb extensions, which are expected to reduce speeds along Blackhawk Street. However, to increase pedestrian safety and further reduce vehicle speeds along this roadway, unique crosswalk treatments should be considered as a traffic calming measure.
- Given the planned redevelopment of Blackhawk Street with large sidewalk buffers, low vehicle speeds, and a small number of travel lanes, this roadway is anticipated to produce high pedestrian comfort levels according to the *Boulder Low-Stress Walk and Bike Network Plan*.

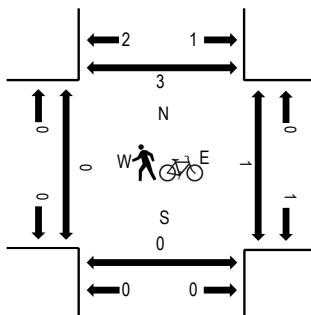

APPENDIX A. TRAFFIC COUNTS

Location: 1 ABILENE ST & 2ND AVE AM
Date: Wednesday, January 26, 2022
Peak Hour: 07:30 AM - 08:30 AM
Peak 15-Minutes: 07:30 AM - 07:45 AM

Peak Hour - All Vehicles

Peak Hour - Pedestrians/Bicycles on Crosswalk

Note: Total study counts contained in parentheses.

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.
