Salt Lake City, UT 84111

Re: Knights Inn Conversion
Aurora, CO
LSC #200770

Dear Mr. Phipps:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed Knights Inn Conversion to respond to City comments. As shown on Figure 1, the site is located west of Billings Street and south of E. 6th Avenue in Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected long-term background and resulting total traffic volumes on the area roadways; and the site's projected traffic impacts.

LAND USE AND ACCESS

The site currently includes a 153-room hotel and is proposed to be converted to 150 apartment dwelling units. Access exists to Billings Street from two locations as shown in the conceptual site plan in Figure 2. The northern access is right-in/right-out and the southern access is full movement. The applicant plans to update the ADA ramps at both site access intersections and install a raised porkchop island at the right-in/right-out access.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **E. 6th Avenue (SH 30)** is an east-west, six-lane major arterial roadway north of the site. It is classified as R-A (Regional Highway) by CDOT. The CDOT Straight Line Diagram (SLD)

is attached for reference. The intersection with Billings Street is signalized with auxiliary turn lanes. The posted speed limit in the vicinity of the site is 40 mph.

- **Billings Street** is a north-south, two-lane local roadway east of the site. The intersection with E. 6th Avenue is signalized with auxiliary turn lanes. No speed limit is posted.

Existing Traffic Conditions

Figure 3a shows the 2018 existing traffic volumes and posted speed limits in the site's vicinity on a typical weekday based on traffic counts provided by the City. Figure 3b shows the estimated existing 2020 traffic volumes, lane geometry, and traffic control. The 2020 volumes in Figure 3b were estimated by LSC based on the 2018 volumes in Figure 3a, the CDOT 20-year growth factor of 1.13, and the trip generation potential for the existing hotel.

2022 and 2040 Background Traffic

Figure 4 shows the estimated 2022 background traffic and Figure 5 shows the estimated 2040 background traffic less existing hotel traffic. The 2022 and 2040 background traffic volumes are based on an annual growth rate of just over 0.6 percent from the 2020 traffic volumes in Figure 3b based on the CDOT 20-year growth factor of 1.13.

Existing, 2022, and 2040 Background Levels of Service

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay and LOS F is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in the study area were analyzed to determine the existing, 2022 and 2040 background levels of service using Synchro. Table 1 shows the level of service analysis results. The level of service reports are attached.

- **E. 6th Avenue (SH 30)/Billings Street:** This signalized intersection currently operates at an overall LOS "E" during the morning peak-hour and LOS "F" during the afternoon peak-hours and is expected to operate at LOS "F" in both peak-hours by 2040.
- **Billings Street/Knights Inn Access/Retail Access:** All movements at this unsignalized intersection currently operate at LOS "B" or better during both morning and afternoon peak-hours and are expected to do so through 2040.
- **Billings Street/RIRO Access:** All movements at this unsignalized intersection currently operate at LOS "A" during both morning and afternoon peak-hours and are expected to do so through 2040.
- **Billing Street/Denny's Access:** All movements at this unsignalized intersection currently operate at LOS "B" or better during both morning and afternoon peak-hours and are expected to do so through 2040.

The 2022 background level of service at the E. 6th Avenue (SH 30)/Billings Street intersection is better than the existing scenarios because the 2022 background level of service assumes the existing hotel traffic has been removed from the roadway network.

The first submittal traffic study reported the signalized level of service in the Synchro format to show the assumed phasing plan. The City commented that the *Highway Capacity Manual* (HCM) should be used instead of the Synchro format. Typically, these formats report different but similar results due to the different methodologies involved. In this case, the HCM format reports similar results for the east-west movements but considerably worse for the side road approaches which considerably dropped the overall intersection level of service for the second version of the traffic study.

TRIP GENERATION

Table 2 shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the existing and proposed land uses on the site based on the rates from *Trip Generation, 10th Edition, 2017* by the Institute of Transportation Engineers (ITE).

The site is projected to generate about 1,098 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 17 vehicles would enter and about 53 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 53 vehicles would enter and about 31 vehicles would exit. These estimates are expected to be reduced by about 15 percent because bus transit with more than 15-minute headings is walkable from the site. In addition, the 2nd Avenue/Abilene RTD passenger rail station is about a half-mile walk to the south.

It is important to note the proposed land use has a similar trip generation potential as the previous hotel land use.

TRIP DISTRIBUTION

Figure 6 shows the estimated directional distribution of the site-generated traffic volumes on the area roadways. The estimates were based on the location of the site with respect to the regional population, employment, and activity centers; and the site's proposed land use.

TRIP ASSIGNMENT

Figure 7 shows the estimated site-generated traffic volumes based on the directional distribution percentages (from Figure 6) and the trip generation estimate (from Table 2).

2022 and 2040 TOTAL TRAFFIC

Figure 8 shows the 2022 total traffic which is the sum of the background traffic volumes (from Figure 4) and the site-generated traffic volumes (from Figure 7). Figure 8 also shows the assumed 2022 lane geometry and traffic control which is the same as existing conditions.

Figure 9 shows the 2040 total traffic which is the sum of 2040 background traffic volumes (from Figure 5) and the site-generated traffic volumes (from Figure 7). Figure 9 also shows the assumed 2040 lane geometry and traffic control which is the same as existing conditions.

PROJECTED LEVELS OF SERVICE

The intersections in the study area were analyzed to determine the 2022 and 2040 total levels of service. Table 1 shows the level of service analysis results. The level of service reports are attached.

- **E. 6th Avenue (SH 30)/Billings Street:** This signalized intersection is expected to operate at an overall LOS “F” during both morning and afternoon peak-hours through 2040 with or without the addition of site traffic.
- **Billings Street/Knights Inn Access/Retail Access:** All movements at this unsignalized intersection are expected to operate at LOS “C” or better during both morning and afternoon peak-hours through 2040.
- **Billings Street/RIRO Access:** All movements at this unsignalized intersection are expected to operate at LOS “A” during both morning and afternoon peak-hours through 2040.
- **Billing Street/Denny’s Access:** All movements at this unsignalized intersection are expected to operate at LOS “B” or better during both morning and afternoon peak-hours through 2040.

It is worth noting the difference in the 2040 background and total traffic overall delay at the E. 6th Avenue (SH 30)/Billings Street is partially due to the existing hotel trips being removed from the background scenarios and the proposed use trips added in the total scenarios. The overall delay would be more similar if the existing hotel trips were included in the background traffic scenario. The traffic impact of the site redevelopment is expected to be minimal.

PEDESTRIAN CONNECTIVITY AND LEVEL OF SERVICE

Residents will be able to cross both E. 6th Avenue (SH 30) and Billings Street at the existing pedestrian crossings located at the signalized E. 6th Avenue (SH 30)/Billings Street intersection. There are existing sidewalks connecting the site south to the 2nd Avenue/Abilene RTD passenger rail station. The applicant will improve the ADA ramps at both site access intersections to improve pedestrian flow and install a raised right-in/right-out porkchop island to help enforce the right-in/right-out configuration of the northern site access.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

1. The site is projected to generate about 1,098 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, about 17 vehicles would enter and about 53 vehicles would exit the site. During the afternoon peak-hour, about 53 vehicles would enter and about 31 vehicles would exit. These estimates are expected to be reduced by about 15 percent because bus transit with more than 15-minute headways is walkable from the site. In addition, the 2nd Avenue/Abilene RTD passenger rail station is about a half-mile walk to the south.

It is important to note the proposed land use has a similar trip generation potential as the previous hotel land use.

Projected Levels of Service

2. The signalized E. 6th Avenue (SH 30)/Billings Street intersection is expected to continue to operate poorly through 2040 with or without redevelopment of the site.
3. All movements at the unsignalized intersections analyzed are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.

Conclusions

4. The impact of the Knights Inn Conversion can be accommodated by the existing roadway network with implementation of the recommendations below.

Recommendations

5. The northern site access should be right-in/right-out-only enforced by a raised pork-chop style median.
6. The applicant should reconstruct the ADA ramps at both site access intersections.

* * * * *

We trust our findings will assist you in gaining approval of the proposed Knights Inn Conversion. Please contact me if you have any questions or need further assistance.

Sincerely,

LSC TRANSPORTATION CONSULTANTS, INC.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
A	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
B	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. The delay could be up to 15 seconds. Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
C	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.
D	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
E	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. There is a high probability that this intersection will meet traffic signal warrants. The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
F	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. The only remedy for these long delays is installing a traffic signal or restricting the accesses. The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.
