SM ROCHA, LLC response to City review comments

## REVISED TRAFFIC IMPACT STUDY

Comments 9.17.19:

1) LOS at Access $A$ is below City's standard with the proposed gating/limiting traffic flow. From page 11 of the COA Traffic Impact Study Guidelines (emphasis added to show where proposal doesn't meet City standards): "Minor movements at unsignalized intersections, such as left turns onto a major arterial from a side street, may be allowed to fall below LOS D pending the specific conditions. Movements which have a light travel demand and a viable travel alternative may be allowed to fall below LOS D."
2) Remove/relocate the gating to allow vehicles from retail/C store / etc to be able to use Access D. Consider relocating gate to north (as indicated on page 5) to maintain the crossaccess and still allow a portion of the truck area to be non-public/secure.
3) See comments throughout.

## Tempur-Sealy 38th and Tower Development Aurora, Colorado

August 2019

1) As discussed during $9 / 23 / 19$ meeting, LOS standards at Access A are met upon consideration of upstream signal gaps and platooning. The revised study and LOS results shown in Tables 6 \& 7 now represent this better.
2) $\operatorname{Per} 9 / 23 / 19$ meeting, proposed gating remains but has been relocated within site to allow for vehicle queueing and turn around at gate.
3)Comment response provided throughout.

## I. Introduction

## Project Overview

This traffic impact study addresses the capacity, geometric, and control requirements associated with the development entitled 38 ${ }^{\text {th }}$ and Tower Development.

This original version of City approved traffic impact study has been revised to address recent City review comments regarding the analysis of traffic impacts associated with Tempur-Sealy and its proposed site plan amendment for minor site items including perimeter fencing.

The following are analysis objectives for this revision to the previously approved traffic impact study ${ }^{1}$ for the overall $38^{\text {th }}$ and Tower development dated June 2018:

- Evaluate internal site traffic distribution and impact from Tempur-Sealy and proposed perimeter fencing with reference to previously approved traffic impact study.
- Evaluate traffic generation relationship to number of dock doors to determine any resulting increase in truck volume for Tempur-Sealy.
- Obtain City support and approval of proposed site plan amendment and perimeter fencing.

The overall and existing mixed-use development is located at the northeast corner of Tower Road and $38^{\text {th }}$ Avenue in Aurora, Colorado. Tempur-Sealy is a warehouse and distribution (general light industrial) tenant within an existing building located immediately east of an existing 7 Eleven.

The applicable areas of revision to this original version of City approved traffic impact study pertain to internal site traffic distribution and access assignment, total traffic analysis, and resulting site access level of service from minor change in site traffic distribution caused by proposed Tempur-Sealy perimeter fencing and limited access to the existing full movement access (Access D) onto 38 ${ }^{\text {th }}$ Avenue. No change to existing and background traffic analysis is needed.

## Study Area Boundaries

The study area to be re-examined in this analysis encompasses the $38^{\text {th }}$ Avenue intersection with Tower Road and existing site accesses.

Figure 1 illustrates location of the site and study intersections.

[^0]
## Site Description

The overall $38^{\text {th }}$ and Tower development entailed new construction of a 7 -Eleven gas station convenience store with 10 fueling positions, a fast food restaurant with drive-through approximately 2,300-square feet in size, a car wash approximately 4,800-square feet in size, and two general light industrial buildings totaling approximately 420,000-square feet in size.

The overall development is surrounded by a mix of commercial, industrial and residential land uses.
Overall site development access is provided at the following locations:

## Tower Road

- Full-movement access (Access A) located approximately 850 feet north of $38^{\text {th }}$ Avenue.
- Right-in / right-out access (Access B) located approximately 300 feet north of $38^{\text {th }}$ Avenue.

## 38th Avenue

- Right-in / right-out access (Access C) located approximately 550 feet east of Tower Road.
- Full-movement access (Access D) located approximately 1,425 feet east of Tower Road.
- Right-in / right-out access (Access E) located approximately 1,725 feet east of Tower Road.
- Full-movement access (Access F) located approximately 2,150 feet east of Tower Road.

Specific access from Tower Road and 38 ${ }^{\text {th }}$ Avenue that serve Tempur-Sealy are Access A, Access C and Access D. Access $C$ is located near the southwest corner of the Tempur-Sealy building and Access $D$ is at the southeast corner.

For purposes of this study revision and to remain consistent with the previously approved traffic study, it is anticipated that development construction would not be phased and be completed by end of Year 2019. This is true to date with the general light industrial building area underway with tenant finishes.

A conceptual site plan, as prepared by Ware Malcomb, is shown on Figure 2. This plan is provided for illustrative purposes only.

## Existing and Committed Surface Transportation Network

Within the study area, $38^{\text {th }}$ Avenue is the primary roadway that will accommodate traffic to and from the proposed development. Tower Road is a secondary roadway. A brief roadway description is provided below:
$38^{\text {th }}$ Avenue is an east-west arterial roadway having a combination of three to four through lanes (one to two lanes in each direction) with a combination of shared and exclusive turn lanes at the intersection within study area. $38^{\text {th }}$ Avenue provides a posted speed limit of 40 MPH.

Tower Road is a north-south arterial roadway having five through lanes (three lanes in the southbound direction, two lanes in the northbound direction) with a combination of shared and exclusive turn lanes at the intersection within study area. 40 MPH is the posted speed limit for Tower Road.

Based on the City of Aurora's 2009 Comprehensive Plan, the eastbound section $38^{\text {th }}$ Avenue, east of Tower Road, is assumed to be widened from one to two through lanes by Year 2037. In Figure 1 (Baseline 2035 Roadway Network) of the Adams County Transportation Plan, Tower Road is envisioned to ultimately become an arterial roadway with six through lanes. However, pursuant to City Staff, northbound Tower Road, south of $38^{\text {th }}$ Avenue, was analyzed with two through lanes by Year 2037 as three through lanes is not feasible due to ROW restrictions.

## Existing Traffic Control Devices

The study intersection of $38^{\text {th }}$ Avenue and Tower Road is signalized. All other study intersections operate under a stop-controlled condition. A stop-controlled intersection is defined as a roadway intersection where vehicle rights-of-way are controlled by one or more "STOP" signs.

## II. Existing Traffic Conditions

Morning (AM) and afternoon (PM) peak hour traffic counts were collected at the $38^{\text {th }}$ Avenue and Tower Road intersection. Observed U-turn volumes were added to the respective left turn movements for analysis purposes. Average daily (24-hour) traffic volumes were collected on Tower Road, and 38th Avenue. These counts are shown on Figure 3.

Traffic count data is included for reference in Appendix A.
Existing signal timing parameters for $38^{\text {th }}$ Avenue and Tower Road was previously obtained from City Staff and used throughout this study to the best extent possible in order to remain consistent with existing signal coordination plans. City signal timing information received is included for reference in Appendix A.

The Signalized and Unsignalized Intersection Analysis techniques, as published in the Highway Capacity Manual (HCM) by the Transportation Research Board and as incorporated into the SYNCHRO computer program, were used to analyze the study intersections for existing traffic conditions. These nationally accepted technique allows for the determination of intersection level of service (LOS) based on the congestion and delay of each traffic movement.

Level of service is a method of measurement used by transportation professionals to quantify a driver's perception of travel conditions that include travel time, number of stops, and total amount of stopped delay experienced on a roadway network. The HCM categorizes level of service into a range from "A" which indicates little, if any, vehicle delay, to " $F$ " which indicates a level of operation considered unacceptable to most drivers. These levels of service grades with brief descriptions of the operating condition, for unsignalized and signalized intersections, are included for reference in Appendix B and have been used throughout this study.

The level of service analyzes results for existing conditions are summarized in Table 1.
Intersection capacity worksheets developed for this study are provided in Appendix C.

| TABLE 1 <br> INTERSECTION CAPACITY ANALYSIS SUMMARY <br> EXISTING TRAFFIC |  |  |
| :--- | :---: | :---: |
| INTERSECTION <br> LANE GROUPS |  | LEVEL OF SERVICE |
| 38th Avenue / Tower Road (Signalized) | AM PEAK HOUR | PM PEAK HOUR |

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)

## Existing Traffic Analysis Results

Under existing conditions, operational analysis shows that the signalized intersection of $38^{\text {th }}$ Avenue with Tower Road has overall operations at LOS C during both the morning and afternoon peak traffic hour.

38TH \& TOWER DEVELOPMENT
Traffic and Transportation Consultants

## III. Future Traffic Conditions without the Proposed Development

Background traffic is the traffic projected to be on area roadways without consideration of the proposed development. Background traffic includes traffic generated by development of vacant parcels in the area.

To account for projected increases in background traffic for Years 2019 and 2037, a compounded annual growth rate of approximately two percent was applied to existing traffic volumes. This annual growth rate was previously approved by City Staff and is consistent with regional growth projections and the level of in-fill development expected within the area.

Pursuant to the roadway improvements discussion provided in Section I, Year 2037 background traffic conditions assume roadway improvements to accommodate regional transportation demands. These improvements include the widening of $38^{\text {th }}$ Avenue to four through lanes and Tower Road to six through lanes. Year 2019 and Year 2037 background traffic conditions assume that the lane geometry, for westbound traffic at $38^{\text {th }}$ Avenue and Tower Road, to be composed of a dedicated left turn lane, an exclusive through lane, and a shared through and right turn lane. Year 2037 assumes existing signal timing parameters for $38^{\text {th }}$ Avenue and Tower Road with optimized intersection splits in effort to better long-term intersection performance. This assumption provides for a conservative analysis.

Projected background traffic volumes and intersection geometry for Years 2019 and 2037 are shown on Figure 4 and Figure 5, respectively.

[^1]As with existing traffic conditions, the operation of study intersections was analyzed under background conditions, without the proposed development, using the SYNCHRO computer program.

Background traffic level of service analyzes results for Year 2019 are listed in Table 2. Year 2037 operational results are summarized in Table 3.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

| TABLE 2 <br> INTERSECTION CAPACITY ANALYSIS SUMMARY BACKGROUND TRAFFIC - YEAR 2019 |  |  |
| :---: | :---: | :---: |
|  |  |  |
|  |  |  |
| INTERSECTION LANE GROUPS | LEVEL OF SERVICE |  |
|  | AM PEAK HOUR | PM PEAK HOUR |
| 38th Avenue / Tower Road (Signalized) | C (34.2) | C (27.8) |

Key: Signalized Intersection: Lev el of Service (Control Delay in sec/veh)

## Background Traffic Analysis Results - Year 2019

Year 2019 background traffic analysis indicates that the signalized intersection of $38^{\text {th }}$ Avenue with Tower Road has overall operations at LOS C during both the AM and PM peak traffic hour.

| TABLE 3 |  |  |
| :---: | :---: | :---: |
|  | INTERSECTION CAPACITY ANALYSIS SUMMARY <br>  <br> BACKGROUND TRAFFIC - YEAR 2037 |  |
| INTERSECTION <br> LANE GROUPS | LEVEL OF SERVICE |  |
|  | AM PEAK HOUR | PM PEAK HOUR |

Key: Signalized Intersection: Level of Service (Control Delay in sec/veh)

## Background Traffic Analysis Results - Year 2037

By Year 2037 and without the proposed development, the study intersection of $38^{\text {th }}$ Avenue with Tower Road is projected to experience an overall LOS C operation during the AM peak traffic hour and LOS $B$ during the PM peak traffic hour.

## IV. Proposed Project Traffic

## Trip Generation

Standard traffic generation characteristics compiled by the Institute of Transportation Engineers (ITE) in their report entitled Trip Generation, 9th Edition, were applied to the proposed land use in order to estimate average daily traffic (ADT), AM Peak Hour, and PM Peak Hour vehicle trips. A vehicle trip is defined as a one-way vehicle movement from a point of origin to a point of destination.

This study revision continues use of Trip Generation, gth $^{\text {th }}$ Edition, to remain consistent with the previously approved traffic study.

The ITE land use code was used for estimating trip generation because of its best fit to the proposed land use description.

Trip generation rates used in this study are presented in Table 4.

| TABLE 4 <br> TRIP GENERATION RATES |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { ITE } \\ & \text { CODE } \end{aligned}$ | LAND USE | UNIT | TRIP GENERATION RATES |  |  |  |  |  |  |
|  |  |  | $\begin{gathered} 24 \\ \text { HOUR } \end{gathered}$ | AM PEAK HOUR |  |  | PM PEAK HOUR |  |  |
|  |  |  |  | ENTER | EXIT | TOTAL | ENTER | EXIT | TOTAL |
| 110 | General Light Industrial | KSF | 6.97 | 0.81 | 0.11 | 0.92 | 0.12 | 0.85 | 0.97 |
| 945 | Gas / Convenience | VFP | 162.78 | 5.08 | 5.08 | 10.16 | 6.76 | 6.76 | 13.51 |
| 934 | Fast Food with Drive-Through | KSF | 496.12 | 23.16 | 22.26 | 45.42 | 16.98 | 15.67 | 32.65 |
| 948 | Automated Car Wash | KSF | 141.20 | * | * | * | 7.06 | 7.06 | 14.12 |

Key: KSF = Thousand Square Feet Gross Floor Area. VFP = Vehicle Fueling Positions.

* = ITE does not report significant AM peak hour generation due to the nature of the business (ie, operating hours ty pically open after AM Note: All data and calculations above are subject to being rounded to nearest value.

Table 5 illustrates projected average daily traffic (ADT), AM Peak Hour, and PM Peak Hour traffic volumes likely generated by the proposed development upon build out.

| TABLE 5TRIP GENERATION SUMMARY |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { ITE } \\ & \text { CODE } \end{aligned}$ | LAND USE | SIZE | TOTAL TRIPS GENERATED |  |  |  |  |  |  |
|  |  |  | $\begin{gathered} 24 \\ \text { HOUR } \end{gathered}$ | AM PEAK HOUR |  |  | PM PEAK HOUR |  |  |
|  |  |  |  | ENTER | EXIT | TOTAL | ENTER | EXIT | TOTAL |
| 110 | General Light Industrial | 287.9 KSF | 2,006 | 233 | 32 | 265 | 34 | 246 | 279 |
| 110 | General Light Industrial | 132.5 KSF | 923 | 107 | 15 | 122 | 15 | 113 | 129 |
| 934 | Fast Food with Drive-Through | 2.3 KSF | 1,157 | 54 | 52 | 106 | 40 | 37 | 76 |
| 945 | Gas / Convenience | 10.0 VFP | 1,628 | 51 | 51 | 102 | 68 | 68 | 135 |
| 948 | Automated Car Wash | 4.8 KSF | 678 | * | * | * | 34 | 34 | 68 |
|  |  | Total: | 6,393 | 445 | 149 | 594 | 190 | 497 | 687 |

Note: All data and calculations above are subject to being rounded to nearest value.

Upon build out, Table 5 illustrates that the proposed development with assumed land uses has the potential to generate approximately 6,393 daily trips with 594 of those occurring during the morning peak hour and 687 during the afternoon peak hour.

## Traffic Generation Dock Door Relationship

As earlier discussed, Tempur-Sealy is a warehouse and distribution facility. Table 4 above defines the ITE land-use category of General Light Industrial and its independent variable of square feet of building floor area to estimate vehicle trip generation for this type of facility.

ITE trip generation rates for transportation engineering applications are traditionally provided for specific land-use categories. These rates provide a well-defined and accepted set of independent variables for estimating vehicle trip generation. These independent variables were developed because they are of particular interest in traffic impact studies and well explain the variability in trip rates. ITE defines an independent variable as a physical, measurable and predictable characteristic that describes the study site of baseline site (for example, gross floor area) and that has a direct relationship to the variation in the number of trips generated by a land use. The independent variables provided for the General Light Industrial land-use category and similar land-use categories are gross floor area, employees, and acres.

An evaluation was conducted to determine if the number of Tempur-Sealy dock doors could determine traffic generation for a warehouse/distribution facility. No relationship or predictable characteristic between number of dock doors to vehicle trip generation is known to existing. Therefore, the vehicle trip generation rate defined in Table 4 and previously approved for overall site development remains valid.

## Adjustments to Trip Generation Rates

While a mixed-use development of this type is likely to attract trips from within area land uses as well as pass-by or diverted link trips from the adjacent roadway system, no trip reduction was taken in this analysis. This assumption provides for a conservative analysis.

As example, published ITE pass-by and diverted link trip data indicates an average trip generation reduction rate between 50 and 85 percent as typical to service stations with convenience store and fast food restaurant with drive-through window. Considering the lowest reduction percentage, primary trip generation from the proposed service station and fast food development equates to half of trip generation volumes presented in Table 5.

A primary trip is defined by ITE as a trip made for the specific purpose of visiting the destination generator.

## Trip Distribution

The overall directional distribution of site-generated traffic was determined based on the location of development site within the City, proposed and existing area land uses, allowed turning movements, and available roadway network. In order to produce the most accurate analysis, the distribution for the development was considered individually due to the nature of each land use type. Distributions were first considered for the general light industrial land use, quick service restaurant and gas/convenience (represented in Figure 6 as "retail").

Overall trip distribution patterns for the development are shown on Figure 6.

## Trip Assignment

Traffic assignment is how generated and distributed vehicle trips are expected to be loaded onto the available roadway network.

Applying trip distribution patterns of individual land uses and sum of respective site-generated traffic provides the overall site-generated trip assignments shown on Figure 6.

## Revised Internal Site Traffic Distribution and Assignment

The previous traffic study approval assumed that a general percentage (approximately 30\%) of traffic generated by the overall retail area (located along Tower Road and on the west side of Tempur-Sealy) would travel east, through the Tempur-Sealy southern drive aisle, to use the full movement access (Access D) and continue travel along 38th Avenue. The total described retail traffic volume is 32 and 41 vehicles occurring during the respective morning and afternoon peak hour.

As discussed above, no trip reduction was taken in this analysis to provide for a conservative analysis.
The site plan amendment for Tempur-Sealy proposes security fencing that would preclude retail traffic travel to Access D. This re-route of retail traffic is minor and not expected to cause a negative impact to retailer, retail patrons or site accesses.

The highest, non-reduced peak hour traffic volume of 41 vehicles was re-routed among available accesses to continue direct or in-direct travel along 38th Avenue. This re-route of traffic is shown on Figure 6.

To provide for a conservative analysis, all previously assumed southbound left turn retail traffic at Access D was re-assigned to the westbound left turn at Access A.

## V. Future Traffic Forecasts with Proposed Development

Site-generated traffic was added to background traffic projections for Years 2019 and 2037 to develop total traffic projections. For analysis purposes, it was assumed that all development construction would be completed by end of Year 2019.

Pursuant to City Staff review comments dated 10/24/17, it is assumed that by Year 2019 Tower Road will become six through lanes north of $38^{\text {th }}$ Avenue. Additionally, pursuant to roadway improvements discussed in Section III, Year 2037 total traffic conditions assume additional roadway improvements to accommodate regional transportation demands beyond that described in background traffic conditions. By Year 2037, 38 ${ }^{\text {th }}$ Avenue is anticipated to expand to accommodate two through lanes in each direction, allowing for dual westbound left turn lanes, two through lanes, and a dedicated right turn lane at its intersection with Tower Road. At its intersection with $38^{\text {th }}$ Avenue, northbound Tower Road was expanded to accommodate dual left turn lanes, two through lanes, and a dedicated right lane. Southbound Tower Road is anticipated to have one dedicated left turn lane, two through lanes, and a shared through and right turn lane. Year 2037 also assumes existing signal timing parameters for $38^{\text {th }}$ Avenue and Tower Road with optimized intersection splits in effort to better long-term intersection performance. This assumption provides for a conservative analysis.

Projected Year 2019 total traffic volumes and intersection geometry are shown in Figure 7.
Figure 8 shows projected total traffic volumes and intersection geometry for Year 2037.

## VI. Project Impacts

The analyses and procedures described in this study were performed in accordance with the Highway Capacity Manual (HCM) and are based upon the worst-case conditions that occur during a typical weekday upon build out of site development and analyzed land uses. Therefore, study intersections are likely to operate with traffic conditions better than those described within this study, which represent the peak hours of weekday operation only.

## Peak Hour Intersection Levels of Service

As with background traffic, the operations of the study intersections were analyzed under projected total traffic conditions using the SYNCHRO computer program. Total traffic level of service analysis results for Years 2019 and 2037 are summarized in Table 6 and Table 7.

Definitions of levels of service are given in Appendix B. Intersection capacity worksheets are provided in Appendix C.

## Total Traffic Analysis Results upon Development Build-Out

Table 7 illustrates how, by Year 2037, the signalized intersection of $38^{\text {th }}$ Avenue with Tower Road shows an overall LOS C operation during morning and afternoon peak traffic hours. Compared to the background traffic analysis results, the traffic generated by the proposed development upon build-out is not expected to significantly change the operations of the study intersection. Compared to Year 2019, the LOS is expected to improve from a LOS D in the morning and afternoon to a LOS C during both the morning and afternoon, due to the assumed optimization of intersection splits and roadway improvements as discussed in Section V.

The intersection of Tower Road with Access A operates at LOS C during the morning peak traffic hour and LOS D during the afternoon peak traffic hour. Exceptions include the westbound left and right turn movement which is anticipated to operate at LOS F during morning and afternoon peak traffic hours. The LOS F operations are attributed to the through traffic volume along Tower Road and the stopcontrolled nature of the intersection.

The stop-controlled intersection of Tower Road with Access B is projected to have morning peak traffic hour operations at LOS B and LOS C during the afternoon peak traffic hour.

The stop-controlled intersection of $38^{\text {th }}$ Avenue with Access C is projected to have LOS C for both the morning and afternoon peak traffic hours.

The stop-controlled intersection of $38^{\text {th }}$ Avenue with Access D is projected to have LOS E and F operations for morning peak traffic hours and LOS C or better for afternoon peak traffic hours. The LOS E and F operations projected during the morning peak traffic hour are attributed to the through traffic volume along $38^{\text {th }}$ Avenue and the stop-controlled nature of the intersection.

The intersection of $38^{\text {th }}$ Avenue with Access E operates at LOS D during morning peak traffic hours and LOS C during after peak traffic hours.

The stop-controlled intersection of $38^{\text {th }}$ Avenue with Access F is projected to have morning and afternoon peak traffic hour operations at LOS D or better. Exceptions include the eastbound left turn and southbound left turn movements which operate at LOS E and LOS F, respectively, during the AM peak traffic hour. The LOS E and LOS F operations are attributed to the through traffic volume along $38^{\text {th }}$ Avenue and the stop-controlled nature of the intersection.

It is to be noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two Way Stop Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. Upstream signal controls will tend to create additional gaps in the traffic stream for turning movements at site accesses and will most likely provide mitigation to the LOS E and LOS F operations projected during both peak traffic hours.

## Queue Length Analysis

Eastbound left turn lane queue lengths at proposed Access A, Access D and Access F intersections along $38^{\text {th }}$ Avenue were analyzed using Year 2037 total traffic conditions. The analysis yields estimate of $95^{\text {th }}$ percentile queue lengths, which have only a five percent probability of being exceeded during the analysis time period. Queue lengths were modeled and are included with the Synchro worksheets in Appendix C.

No significant queue at the proposed site accesses were indicated. The greatest on-site queue length anticipated at Access A is approximately 203 feet, or eight vehicles, occurring during the afternoon peak hour. The greatest on-site queue length anticipated at Access D is approximately 35 feet, or two vehicles, occurring during the morning peak hour. The greatest on-site queue length anticipated at Access F is approximately 10 feet, or one vehicle, occurring during the morning peak hour. Based upon proposed internal driveway lengths and geometries it is believed these queues can be accommodated.

Furthermore, it is to be noted that the above analysis does not account for potential U-turns where it is believed likely vehicles may not travel north through the site to Access A but may rather exit the site via right-turning movements at Access C and proceed to make U-turns at the signalized intersection of $38^{\text {th }}$ Avenue and Tower Road in order to proceed east on $38^{\text {th }}$ Avenue. This is considered likely given the shorter travel distance such a route offers.

Additionally, as noted in previous sections, it is likely that a significant number for visiting trips may be pass-by trips which would result in fewer vehicles making left turns out of the site. For instance, gas station and fast-food drive-through trips are likely to either come from the north or south and continue north or south, respectively, after visiting the site. It is also noted that intersections operations may be better than indicated given the effects of gaps or platooning cause by upstream signal control. Additional SYNCHRO analysis was performed to provide some consideration of such effects, the results of which are provided in appendix D. Based on these results, the level of service for the westbound left and right turning movements at Access A are shown to improve from failing conditions to LOS C and LOS D during the morning and afternoon peak traffic periods, respectively. Based on the above considerations it is concluded that the re-allocation of left-turn volumes from Access D to Access A are not expected to negatively impact adjacent roadway or intersection operations.

## VII. Conclusion

This revised traffic impact study addresses the capacity, geometric, and control requirements associated with the development entitled $38^{\text {th }}$ and Tower including Tempur-Sealy and proposed site plan amendment.

The overall and existing mixed-use development is located at the northeast corner of Tower Road and 38 th Avenue in Aurora, Colorado. Tempur-Sealy is a warehouse and distribution (general light industrial) tenant within an existing building located immediately east of an existing 7 Eleven.

The overall mixed-use development entailed new construction of a 7-Eleven gas station convenience store with 10 fueling positions, two 3,000 square foot fast food restaurants with drive-through, and two general light industrial buildings.

The study area examined in this revised analysis encompasses the intersection of $38^{\text {th }}$ Avenue with Tower Road and existing site accesses.

Analysis was conducted for critical AM Peak Hour and PM Peak Hour traffic operations for existing traffic condition, Year 2019 and Year 2037 background traffic conditions, and Year 2019 and Year 2037 total traffic conditions.

Analysis of existing traffic conditions indicates that the signalized intersection of $38^{\text {th }}$ Avenue with Tower Road has an overall operation of LOS C or better during morning and afternoon peak traffic hours.

Without the proposed development, Year 2019 background operational analysis shows that the signalized intersection of $38^{\text {th }}$ Avenue with Tower Road has an overall projected operation at LOS C during both the morning and afternoon peak traffic hours.

By Year 2037 and without the proposed development and with anticipated roadway improvements, the $38^{\text {th }}$ Avenue with Tower Road intersection has overall projected operations at LOS C during the AM peak traffic hour and LOS B during the PM peak traffic hour.

Analysis of future traffic conditions indicates that the redistribution of site-generated traffic is expected to create no negative impact to traffic operations for the existing and surrounding roadway system. With all conservative assumptions defined in this analysis, the study intersection is projected to operate at future levels of service comparable to Year 2037 background traffic conditions. Proposed site accesses have long-term operations at LOS D or better during peak traffic periods and upon build-out. There are a few intersections where turn movements are shown to experience LOS E and LOS F operations. These LOS E and LOS F operations are attributed to the through traffic volumes along adjacent roadways and the stop-controlled nature of the intersections. It is to be noted that it is not uncommon for unsignalized movements to or from an arterial roadway, in urban areas, to operate with noticeable delays during peak traffic hours. It is, however, likely that turn movements will operate better than the results obtained with this HCM Two Way Stop Control (TWSC) level of service analysis would indicate, as the HCM analysis may not accurately account for the effect of vehicle platooning and gaps caused by upstream signals. Upstream signal controls will tend to create additional gaps in the traffic
stream for turning movements at site accesses and will most likely provide mitigation to the LOS E and LOS F operations projected during both peak traffic hours.

Analysis results determine no relationship or predictable characteristic between number of dock doors to vehicle trip generation that can be used for Tempur-Sealy.

Analysis results for Tempur-Sealy and the proposed site plan amendment indicate no cause of negative impact to access or public roadway operations upon re-route of retail traffic caused by proposed perimeter fencing. Proposed site plan amendment with perimeter fencing should be allowed.

## APPENDIX B

Level of Service Definitions

The following information can be found in the Highway Capacity Manual, Transportation Research Board, 2010: Chapter 18 - Signalized Intersections and Chapter 19 - Two-Way Stop Controlled Intersections.

## Automobile Level of Service (LOS) for Signalized Intersections

Levels of service are defined to represent reasonable ranges in control delay.

## LOS A

Describes operations with a control delay of 10 s/veh or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If it is due to favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.

## LOS B

Describes operations with control delay between 10 and 20 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.

## LOS C

Describes operations with control delay between 20 and 35 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.

## LOS D

Describes operations with control delay between 35 and 55 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.

## LOS E

Describes operations with control delay between 55 and 80 s/veh and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.

## LOS F

Describes operations with control delay exceeding $80 \mathrm{~s} / \mathrm{veh}$ or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

## Level of Service (LOS) for Unsignalized TWSC Intersections

| Level of Service | Average Control Delay (s/veh) |
| :---: | :---: |
| A | $0-10$ |
| B | $>10-15$ |
| C | $>15-25$ |
| D | $>25-35$ |
| E | $>35-50$ |
| F | $>50$ |

## Intersection Summary

## Cycle Length： 120

## Actuated Cycle Length： 120

Offset： 49.5 （41\％），Referenced to phase 2：NBTL and 6：SBTL，Start of Yellow
Natural Cycle： 75
Control Type：Actuated－Coordinated

Maximum v/c Ratio: 0.89
Intersection Signal Delay: $33.4 \quad$ Intersection LOS: C

Intersection Capacity Utilization 81.4\%
ICU Level of Service D
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
