I. INTRODUCTION

Ware Malcomb, on behalf of NorthPoint Development, is proposing to develop approximately 350 acres primarily in the southwest quadrant of the Picadilly Road and Colfax Avenue intersection in Aurora, Colorado. **Figure 1** illustrates the location of the site and the adjacent primary roadway network (existing and future planned roadways).

The proposed industrial development would consist of approximately 4.2 million square feet of industrial park, approximately 160,000 square feet of mixed retail including a bank and a supermarket, a gas station, and two hotels with a total of 200 rooms. **Figure 2** depicts the current site plan concept.

The purpose of this Transportation Impact Study (TIS) is to estimate the potential impacts specific to the proposed development and to identify any resultant required roadway and/or intersection improvements and traffic control needs. Two future planning horizons were evaluated:

- **Short-Term Future.** This scenario examines the traffic impacts of the construction of the first three industrial buildings, the first of which is currently under construction, which totals approximately 2.2 million square feet of industrial park including a single user fulfilment center that will occupy approximately 1.1 million square feet. This scenario assumes the realignment of Picadilly Road and construction of realigned Colfax Avenue east into the Horizon Uptown development. The estimated build year of this scenario is 2022, prior to the construction of the new I-70/Picadilly Road interchange.
- **Long-Term Future.** This scenario examines the traffic impacts within the context of the year 2040 horizon and full buildup of the project site.

This study leverages the planning effort currently underway in support of the I-70/Picadilly Road interchange. Specifically, the City of Aurora is currently in the midst of reevaluating the Environmental Assessment (EA) and Finding of No Significant Impact (FONSI) originally prepared in 2007, which includes updating the past effort with respect to traffic operations. As part of the City's interchange study, year 2040 traffic projections have been developed, and this TIS was conducted in conformance with the interchange effort. The interchange recently received a \$25 million grant from the USDOT, and City of Aurora and CDOT now plan for construction to begin in 2021 with completion in 2023.

This TIS provides operational information including intersection level of service (LOS) and peak hour queue lengths, both of which inform recommendations in achieving short- and long-term functionality. This serves as an update to the Stafford Logistics Center Traffic Study completed in January 2020.

NORTH

FIGURE 2
Conceptual Site Plan

II. EXISTING CONDITIONS

II.A. Land Use

The proposed site is undeveloped. Limited development around the site exists, including the Aurora Sports Park and M & M Auto to its west, single-family housing to its north (which is set back from Colfax), and large-lot residential development southeast of the site. An approved mixed use development, referred to as Horizon Uptown, is planned east of the site across Picadilly Road.

II.B. Roadway System

Roadways near the site are further described as follows:

- **Colfax Avenue** is a four-lane divided east-west state highway (US 40 and Business I-70) along the site's northern boundary. This roadway is currently a four-lane median-separated highway adjacent to the site and extends west through Aurora to downtown Denver and further to Golden. To the east, Colfax Avenue directly merges with I-70. Drivers also have the option of using the I-70 Frontage Road along the south side of Colfax Avenue, which connects through the I-70/E-470 interchange and parallels I-70 along its south side to the east. The posted speed limit adjacent to the site is 55 miles per hour (MPH).
- **Picadilly Road** is a two-lane north-south road that currently extends along the site's east side. Picadilly Road extends approximately 2 miles south from the I-70 Frontage Road to SH 30. Longer term, this roadway's alignment is planned to shift west near Colfax Avenue, extend north to a new interchange with I-70, and connect with the existing Picadilly Road north of Smith Road. Its ultimate cross-section is planned to be a six-lane major arterial facility. Adjacent to the site, the existing posted speed limit is 45 MPH.

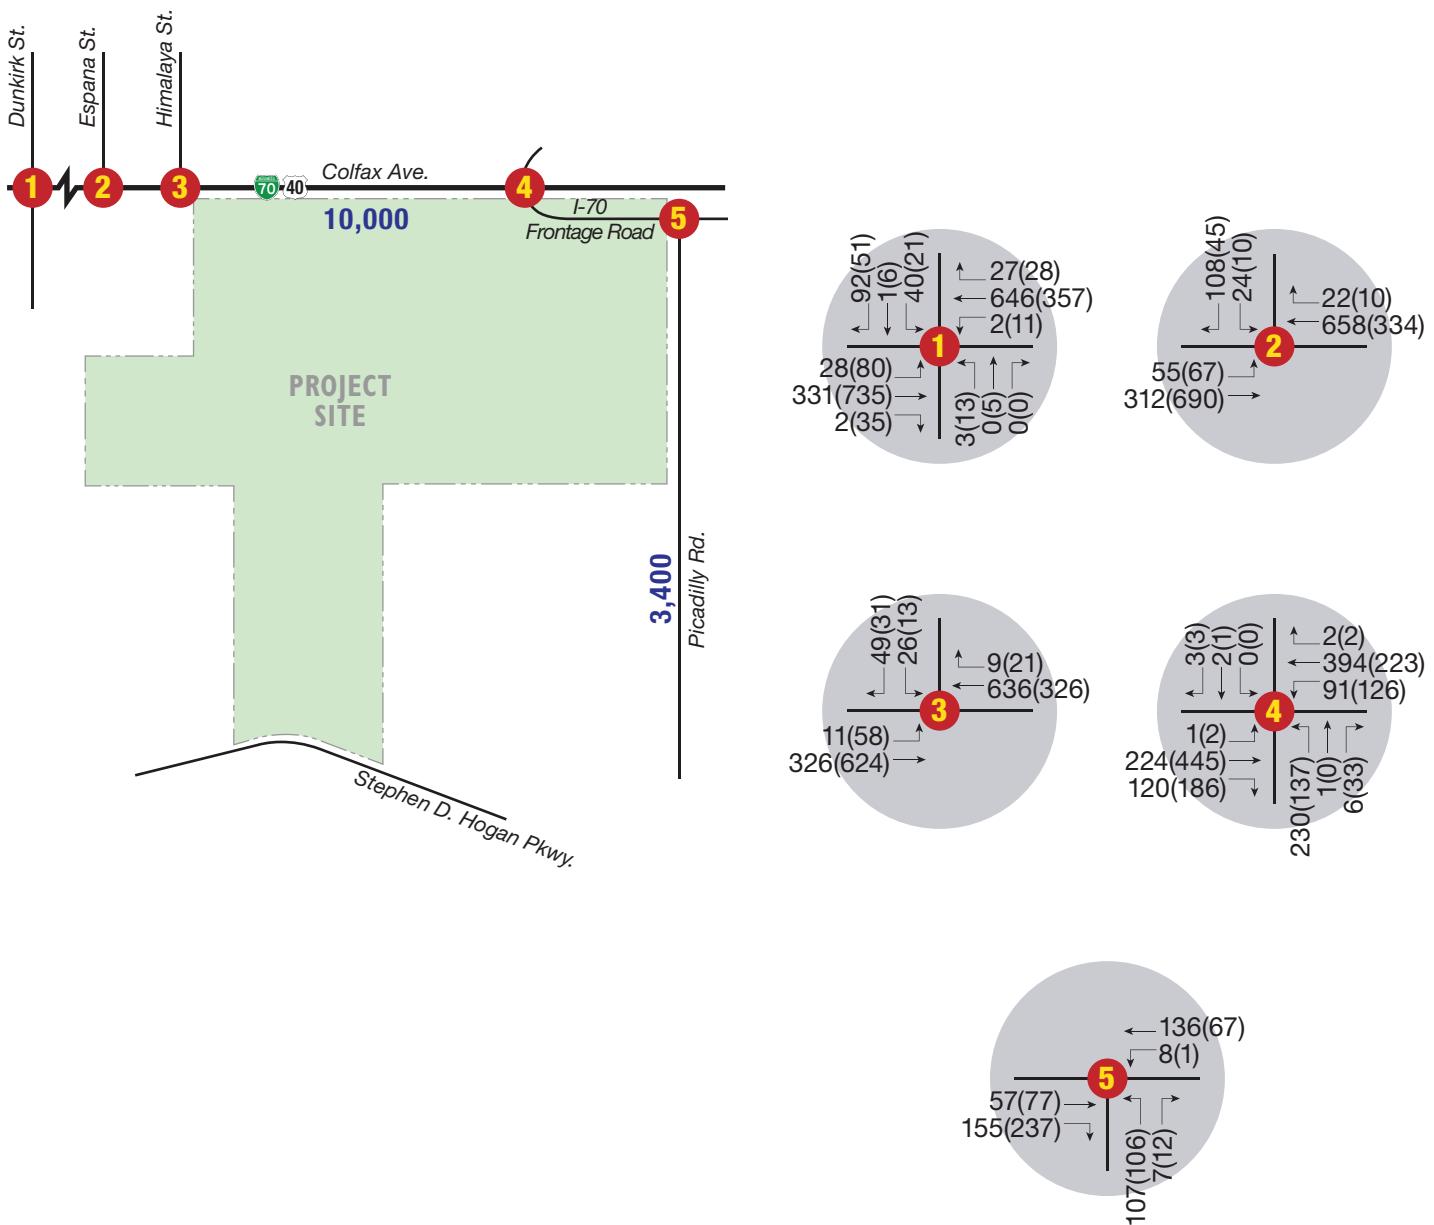

Another key future roadway in the area is Stephen D. Hogan Parkway. This roadway is currently under construction and will connect SH 30 (near the northeast corner of the Buckley Air Force Base) to the E-470/6th Parkway interchange. This roadway is initially being constructed as a two-lane facility, but long-term plans include eventual widening to a six-lane major arterial roadway.

II.C. Traffic Volumes and Operations

Weekday AM and PM peak hour turning movement counts were recently collected along Colfax Avenue. Traffic counts data along Picadilly were obtained from the 6th Avenue Extension study in support of the Stephen D. Hogan Parkway. **Figure 3** shows the data. These improvements have been developed based on the current understanding of the I-70/Picadilly Road interchange project. It is acknowledged that results of the interchange project study may provide additional recommendations at arterial intersections in the study area. **Appendix A** contains count data sheets.

As shown, Colfax Avenue serves 10,000 vehicles per day (VPD). Turning movements at the Colfax Avenue/Dunkirk Street and the Colfax Avenue/I-70 Frontage Road intersections show that Colfax Avenue serves 900 to 1,200 vehicles per hour during the peak hours. Picadilly Road serves a fraction of the traffic that Colfax Avenue serves at 3,400 VPD and approximately 300 vehicles per hour during the peak hours. Turning movements at the Picadilly Road/I-70 Frontage Road and the Colfax Avenue/I-70 Frontage Road intersections indicate a strong pattern between Colfax Avenue to the west and Picadilly Road to the south.

KEY MAP

LEGEND

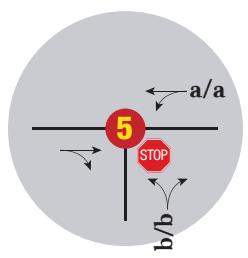

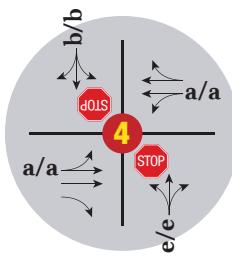

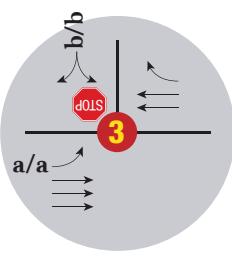

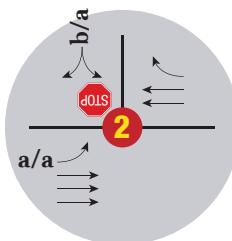

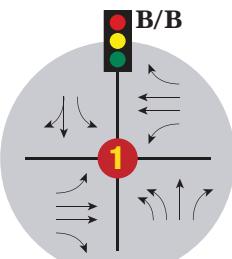

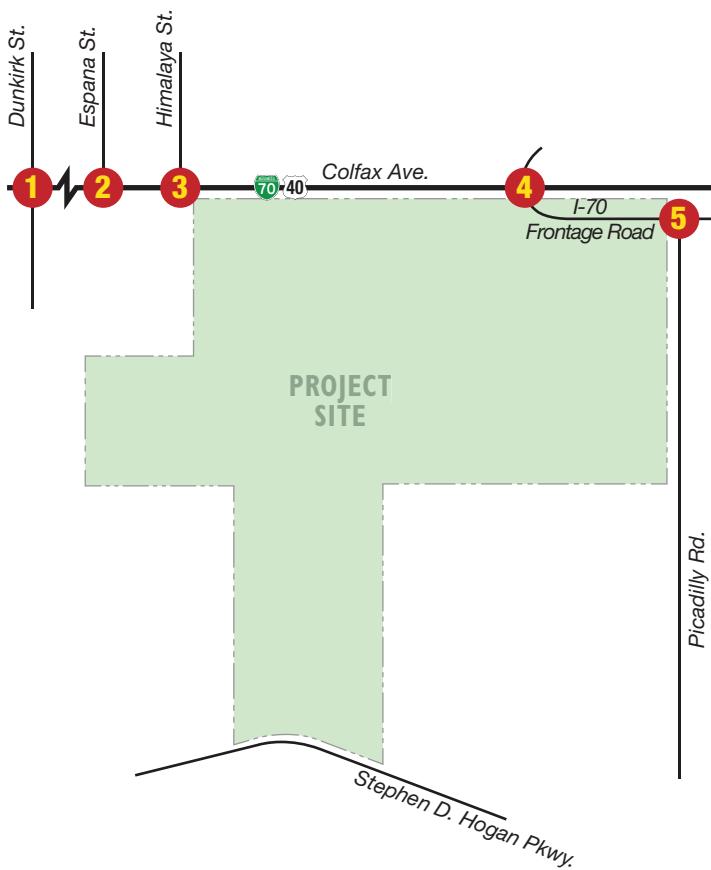

XXX(XXX) = AM(PM) Peak Hour Traffic Volumes

XXXX = Daily Traffic Volumes

Traffic operations within the study area were evaluated according to techniques documented in the Highway Capacity Manual, 6th Edition (Transportation Research Board, 2016) using the existing traffic volumes, intersection geometry, and traffic control. LOS is a qualitative measure of traffic operational conditions based on roadway capacity and vehicle delay. LOS is described by a letter designation ranging from A to F, with LOS A representing almost free-flow travel, while LOS F represents congested conditions. For STOP controlled intersections, LOS is calculated for each movement that must yield the right-of-way. In urbanized areas, LOS D is typically considered to be acceptable for peak hour traffic operations and is the standard set in the City of Aurora TIS Guidelines.

Figure 4 shows the existing traffic control, intersection geometry, and results of the LOS analyses. **Appendix B** includes the analysis worksheets. As indicated, all intersections currently operate within acceptable parameters, at LOS B or better, during peak times with the exception of the northbound approach at the Colfax Avenue/I-70 Frontage Road, which operates at LOS E during both the AM and PM Peak hours due to heavy northbound left turns. Peak hour and four-hour warrants provided in **Appendix H** indicate that signalization at the intersection of Colfax Avenue/I-70 Frontage Road is warranted under current conditions. However, CDOT does not support signalization of this location as this intersection will be eliminated upon realignment of Picadilly Road, and the new intersection of Picadilly Road/Colfax Avenue should be signalized upon construction of the realignment.

III. PROPOSED CONDITIONS

III.A. Site Trip Generation

The current development proposal consists of approximately 4.2 million square feet of industrial park uses and related retail/commercial/hotel uses once built out with approximately 1.1 million square feet being dedicated to a single user fulfilment center. Phase I of the development will include the first three industrial park buildings, the first of which is currently under construction, and the third building is planned to be dedicated to a single user fulfilment center. NorthPoint Development does not intend to build the retail portions of the site until the Horizon Uptown development is well underway or construction of the Picadilly/I-70 interchange is nearly complete as the retail uses will not be supported under current surrounding land use and regional access conditions. A trip generation analysis for the proposed site plan was conducted using average weekday data contained in Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017. **Table I** shows the trip generation estimates.

Table I. Stafford Trip Generation Estimates

Land Use	ITE Code	Quantity	Units	Daily	AM Peak Hour			PM Peak Hour		
					In	Out	Total	In	Out	Total
Industrial Park (Bldg. 1 & 2) ³	130	1,118.1	KSF	3,295	362	85	447	93	354	447
Single User Fulfilment Center ³	Custom	1,079.7	KSF	2,128	161	119	280	240	254	494
Industrial Park (Total)	130	3,124.8	KSF	5,622	1,012	238	1,250	262	988	1,250
Shopping Center	820	75.6	KSF	4,971	118	72	190	212	230	442
Supermarket	850	34	KSF	3,623	78	52	130	178	171	349
Drive-in Bank	912	6	KSF	614	33	24	57	61	62	123
Hotel	310	200	Rooms	1,672	56	39	95	63	61	124
Gas/Service Station	945	16	Pumps	2,752	82	82	164	112	112	224
Short-Term Total Trips					5,423	523	204	727	333	608
Long-Term Total Trips					21,382	1,540	626	2,166	1,128	1,878
Internal Capture Reduction¹					380	5	5	10	19	19
Pass by Reduction²					1,376	41	41	82	56	56
Total New External Trips					19,626	1,494	580	2,074	1,053	1,803
										2,856

Notes:

1. Daily internal capture is assumed to be 10 times the PM value as calculated using ITE methodology. See text relative to Peak Hour internal trip-making.

2 Pass by reduction of 50% for Gas/Service Station is assumed from traffic passing the site along Picadilly Road.

3. Use is part of the short-term timeframe development.

NCHRP 684 provides methodology for internal capture reductions based on the interactions of different land uses within mixed-use developments, including office, retail, restaurant, residential, cinema, and hotel. The methodology considers that mixed-use developments will keep a portion of the trips generated internal to the site, thus reducing impacts to the adjacent roadway network. Internal capture worksheets can be found in **Appendix C**.

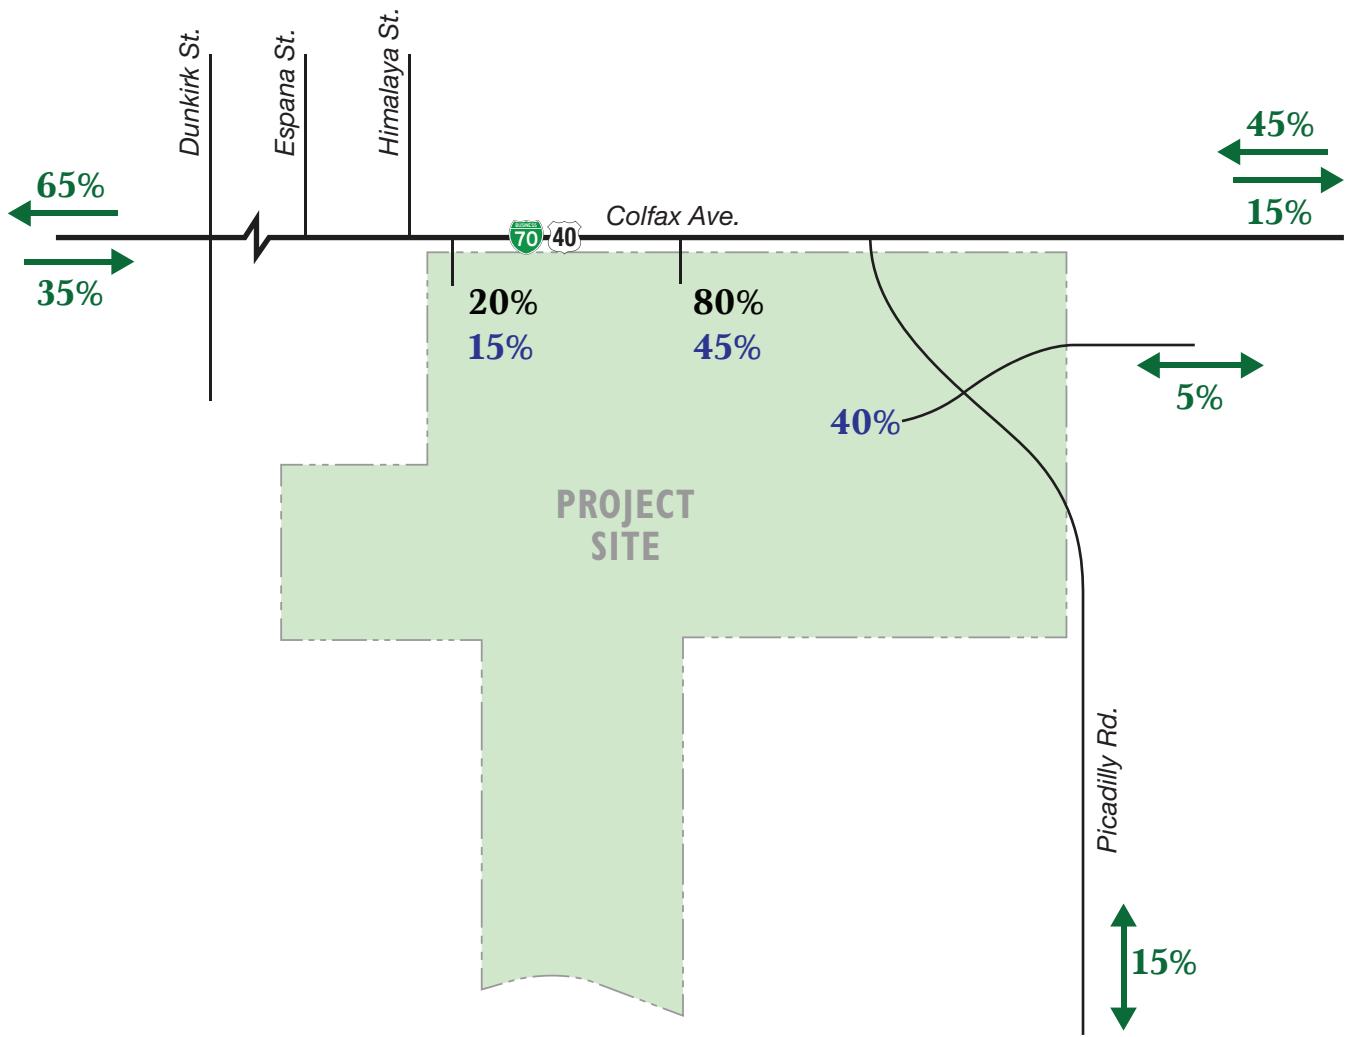

As can be seen, the proposed development would generate approximately 19,600 external trips per day, with about 2,100 AM peak hour trips and about 2,900 PM peak hour external trips. The first phase of development includes the first two industrial park buildings, plus the single user fulfilment center, which generates about 5,400 trips per day. Approximately 10 percent of the trip generation associated with the industrial park uses will be larger trucks based on data for warehousing and industrial parks provided in the Trip Generation Handbook, 3rd Edition, ITE, 2014.

III.B. Trip Distribution and Traffic Assignment

Trip distribution percentages for this site were based, in part, on the turning movement counts and on the Northeast Aurora Transportation Study (NEATS) travel demand model. While not fully in the NEATS study area, the site is immediately adjacent to the NEATS study area and City of Aurora has requested that land use model be used for this project. The geographic distribution is varied between the short- and long-term planning horizons realizing that the development will only be partially complete in the short-term, and access will be limited to one right-in/right-out and two full movement accesses (one onto Colfax Avenue and one onto Picadilly Road). Over the short-term, site traffic will rely on Colfax Avenue and Picadilly Road for access. The short-term analysis further reflects a scenario in which the I-70/Picadilly Road interchange would not yet be built nor will the continuity of Picadilly Road across I-70 be established. Access to Picadilly Road is provided only in the third year of the short-term scenario. Longer term, site traffic will have more options including Picadilly Road's full connection to I-70 and an access onto Stephen D. Hogan Parkway along the site's south side.

Figure 5 shows the short-term site-trip distribution percentages, and **Figure 6** shows the short-term trip assignment resulting from applying the percentages. As indicated, the development's greatest impact in the short-term is expected to be onto Colfax Avenue, adding 2,300 VPD onto this roadway to the site's east and west upon completion of the first three buildings. Entering and exiting trips along Colfax Avenue differ due to the existing interchange not providing access onto westbound I-70, resulting in heavier exiting trips to the west to access I-70 via Tower Road.

Figure 7 and **Figure 8** show the long-term site-trip distribution percentages for the industrial and retail portions of the site, respectively. These vary as the industrial portion of the site will have more of a regional distribution while the retail will be focused more locally. **Figure 9** and **Figure 10** show the long-term trip assignments resulting from applying the percentages for the industrial and retail portions of the site, respectively. As indicated, from combining traffic volumes from **Figure 9** and **Figure 10**, the development's greatest impact in the long-term is expected to be onto Picadilly Road to the north, adding 7,400 VPD. Picadilly Road to the south would serve 3,900 VPD, Colfax Avenue to the west would serve 5,600 VPD, Colfax Avenue to the east would serve 3,400 VPD, and Stephen D. Hogan Parkway would serve 1,900 VPD.

IV. FUTURE CONDITIONS

IV.A. Short-Term Future Background

Roadway System

The short-term scenario evaluates the first three years of the Stafford Logistics Center. Improvements associated with the I-70/Picadilly interchange are not anticipated in this timeline; however, the realignment of Picadilly Road is anticipated during year three.

Traffic Volumes

Phase I of the development will consist of the first three buildings of the industrial park portion of the site, the first of which is currently under construction, and the third building is dedicated to the single user fulfilment center. Access will be provided onto Colfax Avenue via one right-in/right-out and one full movement access, and upon completion of the Picadilly Road realignment, one full movement access onto Picadilly Road via 13th Avenue/realigned Colfax Avenue. The right-in/right-out access onto Colfax Avenue is intended to provide shared access with the adjacent property to the west. The key intersections of analysis include Colfax Avenue/Dunkirk Street, Colfax Avenue/Espana Street, Colfax Avenue/Himalaya Street, Picadilly Road/Colfax, and Picadilly Road/13th Avenue/realigned Colfax. The I-70/Picadilly Road interchange is not assumed to be constructed within the short-term timeframe. The signalization of Colfax Avenue/I-70 Frontage Road will be warranted with background traffic and it is assumed Picadilly Road/Colfax Avenue will be signalized upon realignment of Picadilly Road as that intersection will replace the existing intersection.

Background traffic is the component of roadway volumes that would use the adjacent roadway system regardless of site development. Along Colfax Avenue adjacent to the site, moderate to heavy growth is expected over the next few years based on data from the NEATS model and other developments near the site. For this analysis, a 6 percent annual growth was assumed for the entire study area.

Figure 11 illustrates short-term background traffic volumes.

Traffic Control

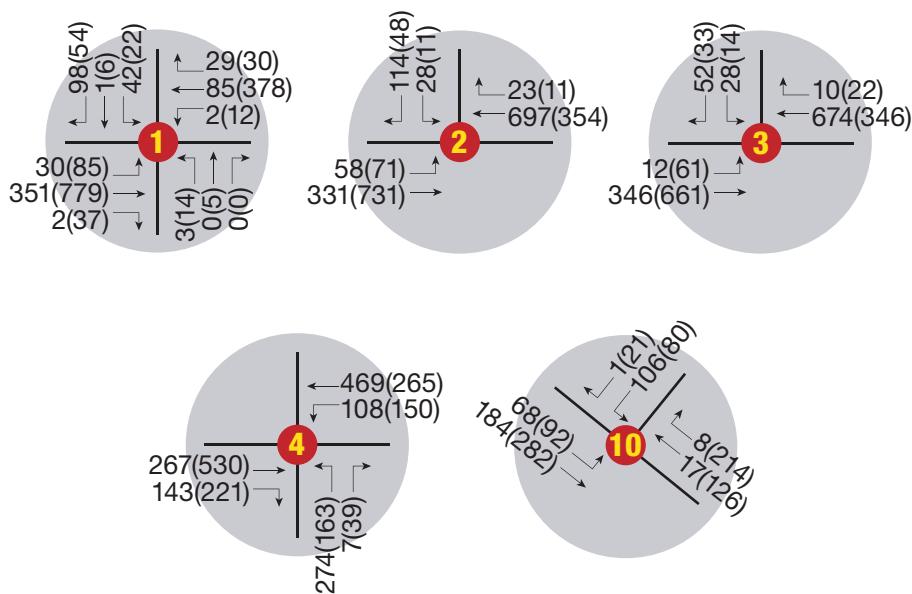

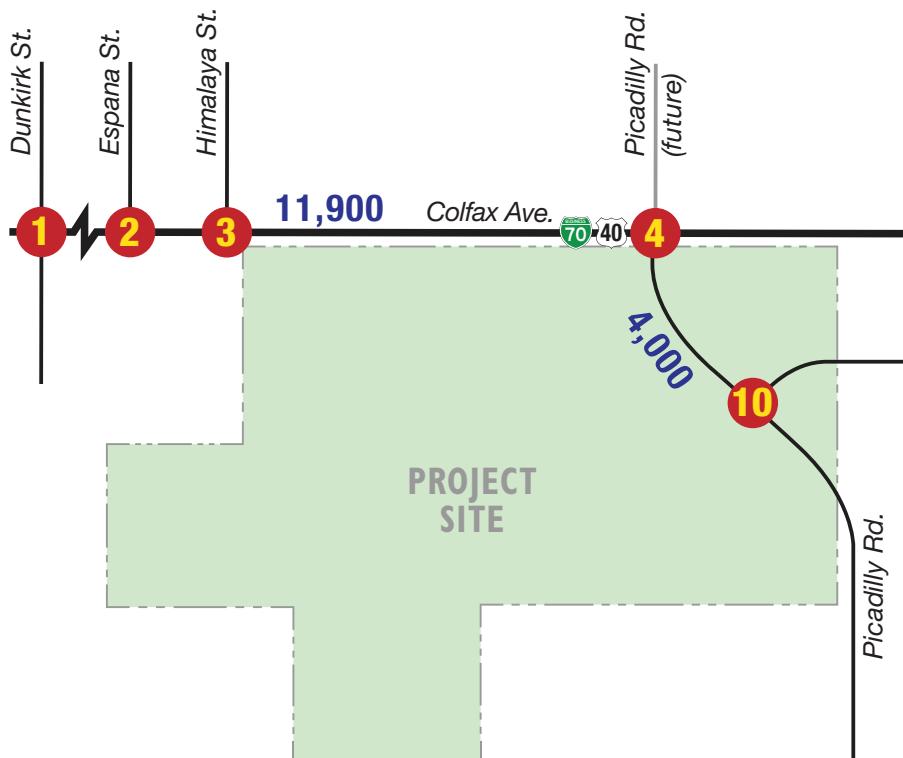

The short-term background traffic is not anticipated to trigger any additional signalization warrants. All intersections are assumed to be side-street-stop controlled except Colfax Avenue/Dunkirk Street, which is signalized under existing conditions, and Colfax Avenue/Picadilly Road, which meets warrants under existing conditions as the intersection of the Colfax Avenue/I-70 Frontage Road. The signalization of Colfax Avenue/Picadilly Road should be closely coordinated with the I-70/Picadilly Road interchange project to ensure that the initial design considers the subsequent geometric shift when Colfax Avenue is eliminated to the east and Picadilly Road continues north to the relocated interchange.

Traffic Operations

The short-term background traffic volume magnitudes are only marginally greater than existing conditions. As such, short-term traffic operations are similar to those of existing conditions. As indicated, all intersections are projected to operate within acceptable parameters, at LOS C or better.

Short-term future background traffic volumes were used as the basis for intersection capacity analyses, the results of which are shown on **Figure 12**, and LOS worksheets can be found in **Appendix G**. No LOS issues will exist in the short-term planning horizon given background traffic, assuming the traffic control and lane geometry described herein.

IV.B. Long-term Future Background

Roadway System

By year 2040, Stafford is assumed to be built out. This includes the existing roadways, as well as:

- Realignment of Picadilly Road to the west at Colfax Avenue.
- Extension of Picadilly Road north of Colfax Avenue crossing over I-70 and connecting with Picadilly Road at Smith Road.
- A reconfigured interchange between I-70 and Picadilly Road providing all movements to/from I-70 (not all are provided today), and removal of the east leg of the Colfax Avenue/Picadilly Road intersection that currently serves the existing ramps.
- The completion of the Stephen D. Hogan Parkway along the site's south side. This will be completed as a four-lane cross section in the short-term scenario and a six-lane cross section in the long-term scenario.

Traffic Volumes

Long-term background traffic has been estimated from traffic projections developed in support of the I-70/Picadilly Road projections prepared by HDR, Inc. for the I-70/Picadilly Road interchange study. These projections were based on the current Denver Regional Council of Governments (DRCOG) travel demand model. In developing background traffic for the Stafford TIS, adjustments were made to the interchange projections to remove trips associated with the 350 acres associated with the Stafford development. Volumes were also added entering and exiting the southbound legs of intersections along Colfax Avenue to account for the undeveloped strip of land between Colfax Avenue and the residential development to the north and the 65-acre parcel between Lisbon Street and Picadilly Road, which are all zoned for commercial use. ITE land use 820 (Shopping Center) with an FAR of 0.2 was assumed for these properties.

Results of the above adjustments provided background traffic forecasts illustrated on **Figure 13**. Picadilly Road is estimated to serve the greatest amount of background traffic reaching up to 41,500 VPD immediately north of the site. Stephen D. Hogan Parkway will also serve a significant amount of traffic reaching as much as 38,400 VPD. Picadilly Road to the south is projected to serve 22,500 VPD, Colfax Avenue to the west is projected to serve 28,000 VPD, and Colfax Avenue to the east is projected to serve 20,400 VPD.

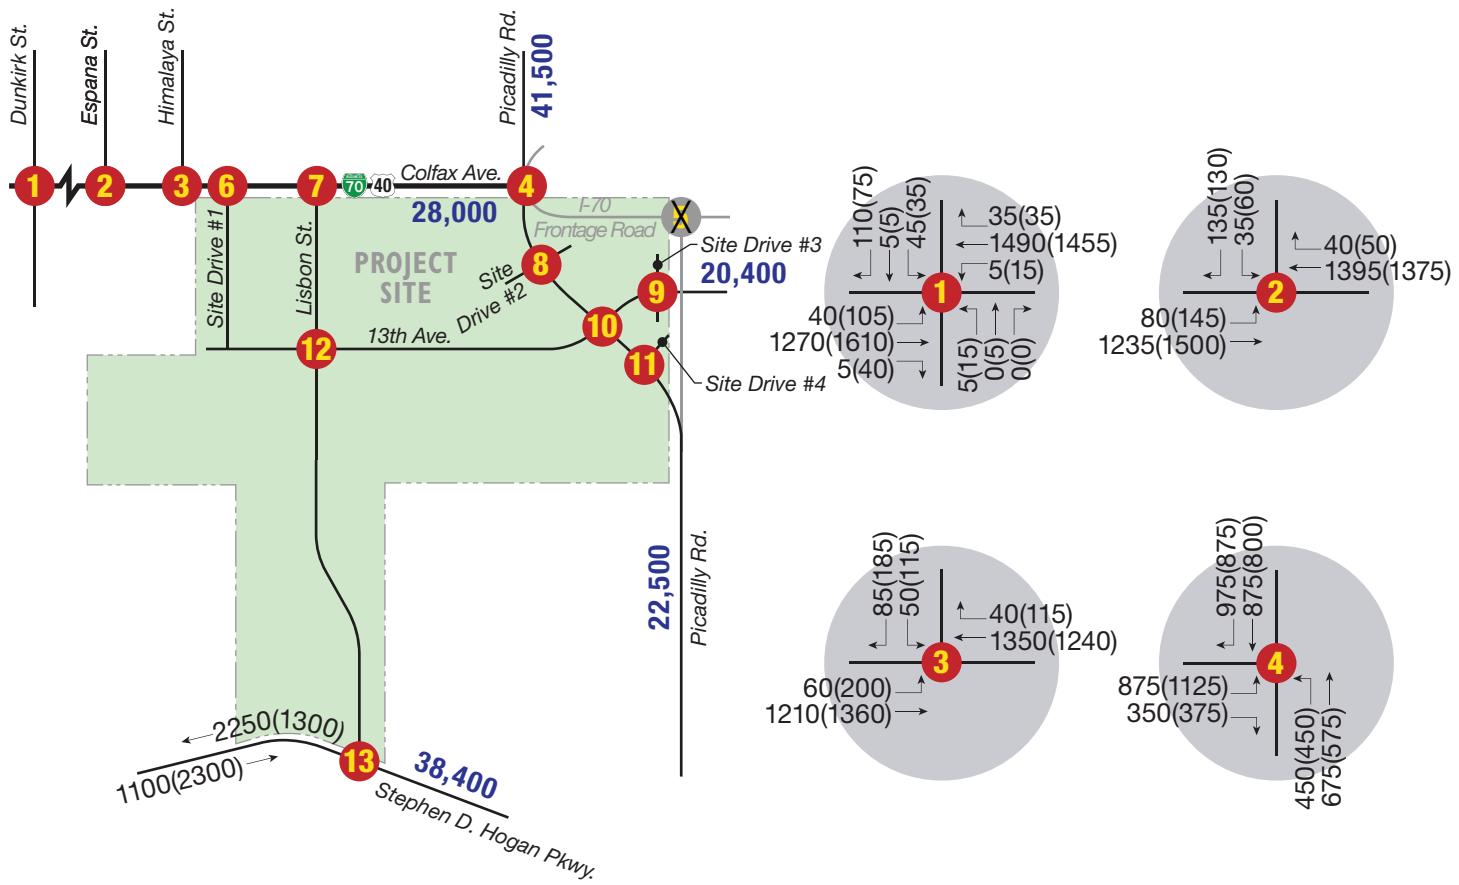

Traffic Control

Signalization of several intersections along Colfax Avenue is assumed in the long term. Future background traffic levels are projected to warrant signalization at the following intersections within the study area:

- Colfax Avenue/Picadilly Road
- Colfax Avenue/Himalaya Street
- Colfax Avenue/Lisbon Street
- Picadilly Road/relocated Colfax Avenue (south of Colfax Avenue section line)

Colfax Avenue/Picadilly Road and Picadilly Road/relocated Colfax Avenue are assumed to be signalized based on the I-70/Picadilly Road project. Peak hour and four-hour signal warrants are met at Colfax Avenue/Himalaya Street and at Colfax Avenue/Lisbon Street and are provided in **Appendix H**. The Colfax Avenue/Espana Street intersection was not evaluated as CDOT does not support signalization due to the proximity to Colfax Avenue/Dunkirk Street to the west.

KEY MAP

LEGEND

XXX(XXX) = AM(PM) Peak Hour Traffic Volumes

XXXX = Daily Traffic Volumes

NORTH

FIGURE 13

Long-Term Future (2040) Background Traffic Volumes

Traffic Operations

Long-term future background traffic volumes were used as the basis for intersection capacity analyses, the results of which are shown on **Figure 14** (**Appendix G** includes LOS worksheets).

As indicated, all intersections are projected to operate within acceptable parameters, at LOS D or better, during peak times with the exception of the southbound left-turn movement at Colfax Avenue/Espana Street, which is projected to operate at LOS E during both peak hours. This includes significant widening of the intersections to include numerous auxiliary lanes as well as signalization. Key laneage needs include four-laning of Picadilly Road and four-laning of the off-alignment Colfax Avenue east of Picadilly Road. The major intersections, such as Colfax Avenue/Picadilly Road and Picadilly Road/relocated Colfax Avenue, will also need dual left turn lanes and separate right turn lanes along select approaches due to background traffic demands alone.

IV.C. Total Traffic Conditions

Short-term Future

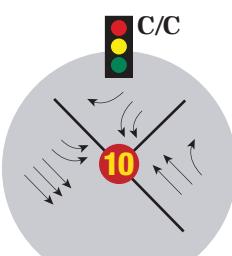

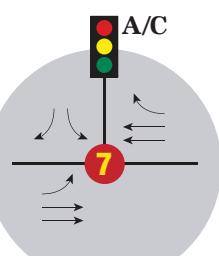

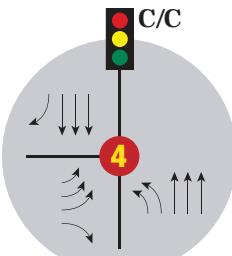

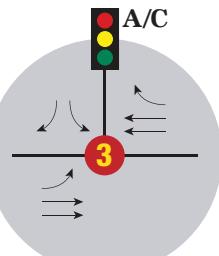

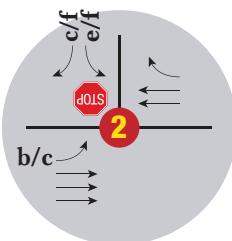

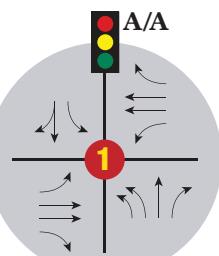

The short-term site generated traffic volumes (**Figure 5**) were added to the corresponding background volumes (**Figure 11**) to produce the short-term future total traffic volumes shown on **Figure 15**. As shown, traffic volumes along Colfax Avenue would reach as much as 14,200 VPD upon completion of the first three buildings, of which the first phase of Stafford would make up 16 percent of the total traffic. Traffic volumes along Picadilly Road would reach as much as 5,000 VPD, of which the first phase of Stafford would make up 20 percent of the total traffic. In the short-term scenario, access to the site will be provided by one right-in/right-out and one full movement access onto Colfax Avenue and one full movement access onto Picadilly Road.

Intersection capacity analyses were conducted using the short-term total peak hour volumes and intersection geometrics as illustrated on **Figure 16**. A 10 percent heavy vehicle was used throughout the study area with an increase to 25 percent for all movements entering and exiting the site.

Appendix F includes analysis worksheets. As indicated, traffic operations would remain acceptable at LOS D or better. Picadilly Road daily volumes would indicate that the segment south of Colfax Avenue will continue to maintain an LOS of C or better with a two-lane cross-section based on volume thresholds presented in the NEATS study.

Short-term total traffic volumes will warrant signalization at Colfax Avenue/Lisbon Street (Full Access Site Driveway). Dual left turns for the northbound approach of the Colfax Avenue/Lisbon Street intersection are recommended for the short-term total conditions along with a northbound channelized right turn with acceleration lane. The intersection of Picadilly Road/Realigned Colfax Avenue is not anticipated to meet warrants in the short-term total scenario but should continue to be monitored as Stafford continues to develop as well as Horizon Uptown to the east. The peak hour and four-hour warrants are provided in **Appendix H**, and 70 percent warrants were used as the current posted speed on Colfax Avenue is 55 MPH and 45 MPH on Picadilly Road.

NORTH

FIGURE 16

Short-Term Future Total Traffic Conditions

Additional traffic growth is needed on side street approaches before signal warrants are satisfied at the Colfax Avenue/Himalaya Street intersection, and CDOT has stated that they do not support signalization of Colfax Avenue/Espana Street. The ultimate signalization of Colfax Avenue/Picadilly Road will replace the intersection of the Colfax Avenue/I-70 Frontage Road as part of the I-70/Picadilly Road interchange project. However, warrant analysis indicates signalization of the existing intersection is currently warranted under existing conditions. Interim signalization is assumed for the purposes of this study, but coordination with the I-70/Picadilly Road interchange project should be considered as the layout of this intersection will change with completion of that project.

Intersection movement queuing has also been assessed given the short-term traffic projections for year three. **Table 2** presents the results.

Table 2. Short-term Future 95th Percentile Queueing – Stafford

Intersection	Direction	95% Queue (ft)		
		Left	Thru	Right
Colfax Avenue/Dunkirk Street (Intersection #1)	Eastbound	25	175	0

	Westbound	25	25	25
	Northbound	25	--	
	Southbound	25	--	
Lisbon Street/Southern Colfax Avenue Alignment (Intersection #12)	Eastbound		25	--
	Westbound	--		25
	Southbound	25	--	0

Long-Term Future

The 2040 site generated traffic volumes (**Figure 9** and **Figure 10**) were added to the long-term future background traffic volumes (**Figure 13**) to produce the year 2040 total traffic volumes illustrated on **Figure 17**. As shown, traffic volumes along Colfax Avenue will increase up to 33,600 VPD by 2040 once the area is built out. Picadilly Road could serve 26,400 VPD south of Colfax Avenue and 48,900 VPD north of Colfax Avenue.

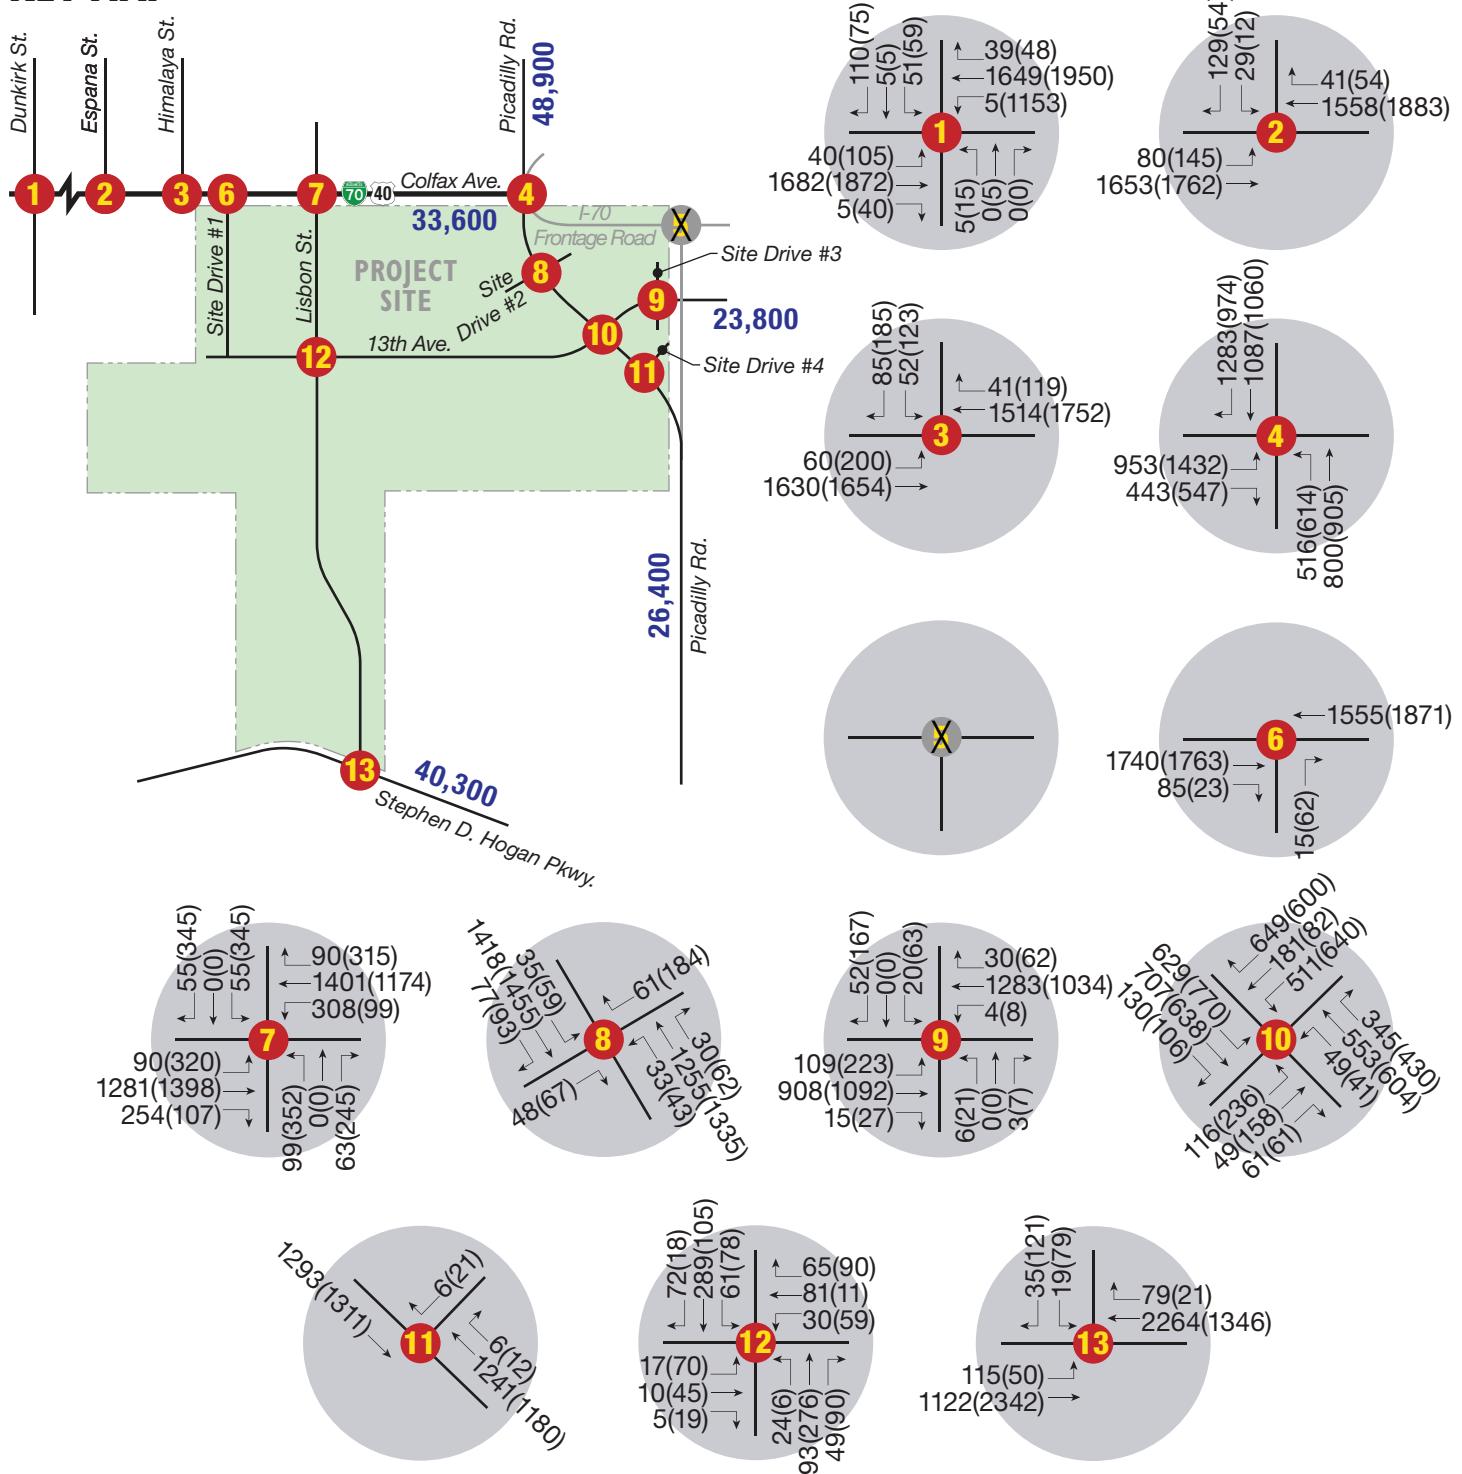

Intersection capacity analyses were conducted using the long-term total peak hour volumes and intersection geometrics, also shown on **Figure 18**. **Appendix G** includes the analysis worksheets. A

10 percent heavy vehicle was used throughout the study area with an increase to 25 percent for all movements entering and exiting or within the industrial portion of the site.

These improvements have been developed based on the current understanding of the I-70/Picadilly Road interchange project. It is acknowledged that the interchange project may provide additional recommendations at arterial intersections in the study area. Results for each intersection are summarized below:

- **Colfax Avenue/Dunkirk Street (Intersection #1)** – Signal (exists today). Colfax Avenue is a major arterial roadway. The intersection does not need any modification from the existing geometry.
- **Colfax Avenue/Espana Street (Intersection #2)** – Tee intersection. Colfax Avenue is a major arterial roadway. The intersection should be modified to include separate southbound left and right turn lanes. CDOT has indicated that this intersection is to remain unsignalized.
- **Colfax Avenue/Himalaya Street (Intersection #3)** – Signal tee intersection. Colfax Avenue is a major arterial roadway. The intersection should be modified to include separate southbound left and right turn lanes.
- **Colfax Avenue/Stafford Access Drive #1 (Intersection #6)** – Stop controlled right-in/right-out. Colfax Avenue is a four-lane major arterial. The intersection will need an eastbound right turn lane.
- **Colfax Avenue/Lisbon Street (Stafford full movement access) (Intersection #7)** – Signal. Colfax Avenue is a four-lane major arterial at the intersection. Lisbon Street will be a two-lane collector providing access to future retail and existing residential properties to the north and to the Stafford Logistics Center to the south. The intersection will need dual left turn lanes and separate right turn lanes along all four approaches. The northbound and southbound right turns should be channelized with acceleration lanes onto Colfax Avenue.
- **Colfax Avenue/Picadilly Road (Intersection #4)** – Signal. Colfax Avenue is a major arterial, and Picadilly Road is planned to be a major arterial that will have a new interchange with I-70. The Colfax Avenue realignment to the south dictates that this will be a “T” intersection. The intersection should include three through-lanes north-south, northbound dual left-turn lanes, triple left-turn lanes along the eastbound approach, and separate right turn lanes with overlap signal phasing along the southbound and eastbound approaches.
- **Picadilly Road/Stafford Access Drive #2 (Intersection #8)** – Stop controlled $\frac{3}{4}$ access. Picadilly Road is a planned six-lane major arterial. The northbound and southbound approaches should have separate left and right turn lanes.
- **Picadilly Road /Southern Colfax Avenue Alignment (Intersection #10)** – Signal. Picadilly Road is a planned six-lane major arterial. The west leg of the intersection will serve as a site access roadway, which will be 13th Avenue through the site. The east leg serves as the Southern Colfax Avenue alignment through the planned Horizon Uptown development. Separate right turn lanes should be included at all approaches with signal phasing overlaps included on the northbound approaches, channelization of the westbound approach right turn, and left turn lanes at all approaches with dual left for the southbound and westbound approaches.

- **Southern Colfax Avenue Alignment/Stafford Access Drive #3 (Intersection #9) – Signal.** The Southern Colfax Avenue alignment is a planned major arterial extending through the planned Horizon Uptown development and the I-70/E-470 interchange, becoming the I-70 South Frontage Road. Peak hour and 4-hour signal warrants were analyzed for the intersection and are provided in **Appendix H**. The PM peak hour narrowly falls below thresholds and a 4-hour warrant with the 2nd-4th highest hour being 90, 85, and 75 percent of the PM peak hour meets for 3 of 4 hours and narrowly misses meeting thresholds for the final hour. Signalization is recommended as even a slight increase in any of the site uses would likely cause warrants to be met. Without signalization, LOS F conditions are expected for the driveway, and this is the only access for the majority of the retail portion of Stafford Logistics Center allowing for movements to the east and south. Additionally, despite not meeting SHAC thresholds a westbound left turn lane is recommended to access the retail uses south of Colfax Avenue to eliminate queuing within a through travel lane. Queuing between this intersection and Picadilly Road/Southern Colfax Avenue Alignment should be considered; the 95th percentile queues between the two intersections require a minimum spacing of 500 feet or 600 feet if left turn lanes cannot be stacked side by side. City of Aurora standard is 660 feet between signalized intersections, which would indicate that the 95th percentile queuing would be adequately accommodated.
- **Picadilly Road/Stafford Access Drive #4 (Intersection #11) – Stop controlled right-in/right-out tee intersection.** Picadilly Road is a planned six-lane major arterial.
- **Stephen D. Hogan Parkway/Jebel Street (Stafford southern access) (Intersection #15) – Stop controlled tee intersection.** Stephen D. Hogan Parkway is a planned six-lane major arterial. The eastbound approach should have a separate left turn lane, the westbound approach should have a separate right turn lane, and the southbound approach should have separate left and right turn lanes. Peak hour and four-hour warrants were analyzed for the intersection and are provided in **Appendix H**. While side street volumes are low and do not approach meeting signal warrants, poor LOS is anticipated. Given the internal roadway network of the site and other signalized driveways, it is anticipated that some drivers will use capacity of other access points to enter and exit the site from Stephen D. Hogan Parkway via Picadilly Road. Due to the need for fire access to the southern portion of the site, it is recommended this be a full access movement despite the higher delay. Additionally median space provided for the eastbound left turn should provide the ability for southbound left turns to make the turn in two stages if necessary. While warrants are not met, the intersection analysis assuming signalization has also been provided at the request of City of Aurora staff.
- **Lisbon Street/13th Avenue (Intersection #13) – All-way stop controlled.** This intersection is internal to the site and a southbound left turn auxiliary lane is recommended. For an all-way stop warrant, the major street volume needs to average at least 300 vehicles per hour and the minor street volume needs to average at least 200 vehicles per hour for any 8 hours of an average day for this warrant to be satisfied. The AM and PM peak hours would experience 550 and 600 along the major (northbound) street and 200 and 300 vehicles per hour along the minor (east-west) street, respectively. Data provided in the December 2015 *Journal of Transportation of the Institute of Transportation Engineers* indicate that roughly 50 percent industrial uses is expected to have a daily distribution in which 10.5 and 10.8 percent of daily traffic is expected during the AM and PM peak hours, respectively, and have a 6.3 percent daily share for the 11 AM hour, which is expected to be the 8th highest hour. Applying these percentages and interpolating the other hours, the 8th highest hour would have a volume of approximately 340 per hour along the major street and 150 per hour along the minor street. It is anticipated that these volumes would satisfy the all-way stop warrant. The City of Aurora requests all intersections identified for all-way stop or signalization be evaluated as roundabouts. However, *NCHRP 672 Roundabouts: An Informational Guide* indicates alternatives to a roundabout should

not be considered when a high percentage of heavy vehicles exists. As such roundabouts are not considered in this study.

As indicated, traffic operations would remain acceptable at LOS D or better, with the following exceptions:

- Colfax Avenue/Espana Drive is projected to operate at LOS F for the stop-controlled southbound left-turn in both the AM and PM peak hours. CDOT does not support signalization due to the proximity to Colfax Avenue/Dunkirk Street to the west.
- Stephen D. Hogan Parkway/Lisbon Street is projected to operate at LOS F for the stop-controlled southbound right-turn in both the AM and PM peak hours, LOS E for the stop-controlled southbound left-turn in the AM peak hour, and LOS F for eastbound left turns in the AM peak hour. Volumes create a borderline condition for signalization based on the peak hour warrants in the PM peak hour and City of Aurora staff has previously indicated that they would support signalization at this location.

An intersection movement queuing analysis was also completed for the perimeter roadway intersections, and the results are shown in **Table 3**.

Table 3. Long-term Future 95th Percentile Queueing – Stafford

Intersection	Direction	95% Queue (ft)		
		Left	Thru	Right

Lisbon Street/12 th Avenue(Internal Site Intersection) (Intersection #12)	Eastbound	50	50	50
	Westbound	50	50	50
	Northbound	125	125	125
	Southbound	125	125	125

Queue lengths are based on lane geometries depicted on **Figure 16**.

The City of Aurora bases the need for auxiliary turn lanes on the CDOT SHAC. CDOT classifies Colfax Avenue as an access category NR-A facility. Based on a speed limit of 55 MPH and the projected volumes presented on **Figure 14**, right turn lanes shall be provided at both site entrance locations along Colfax Avenue and a left turn at the Colfax Avenue/Lisbon Street intersection. These auxiliary lanes shall be sized based on deceleration length plus storage for left turn lanes and deceleration length for right turns. Taper lengths are included in the recommended deceleration length from the SHAC and shall be constructed with a 18.5:1 taper for 55 MPH.

Picadilly Road, realigned southern Colfax Avenue, and Stephen D. Hogan Parkway are planned arterials that would be classified as access category NR-B with 40 MPH posted speed limits. Left and right turn auxiliary lanes are required at all site access points based on the projected volumes presented on **Figure 14** and summarized in **Table 4**. These auxiliary lanes shall be sized based on storage plus taper length using a 12:1 taper according to the SHAC. Storage lengths are recommended at 1 foot per vehicle during the maximum volume in the peak hours rounded up to the nearest 25 feet.

Table 4. Site Driveway Recommended Auxiliary Lane Length

Intersection	Direction	SHAC Recommended Auxiliary Lane Length
Picadilly Road /Southern Colfax Avenue Alignment (Intersection #10)	Northbound Left	75-foot storage plus 150-foot taper
	Southbound Right	200-foot storage plus 150-foot taper
Colfax Avenue/Stafford Site Drive #1 (Intersection #6)	Eastbound Right	600-foot deceleration (includes 225-foot taper)
Colfax Avenue/Lisbon Street (Site Drive) (Intersection #7)	Eastbound Right	600-foot deceleration (includes 225-foot taper)
	Westbound Left ¹	250-foot storage plus 600-foot deceleration (includes 225-foot taper)
Picadilly Road/Stafford Site Drive #2 (Intersection #8)	Northbound Right	75-foot storage plus 150-foot taper
	Northbound Left	50-foot storage plus 150-foot taper
	Southbound Right	125-foot storage plus 150-foot taper
	Southbound Left	75-foot storage plus 150-foot taper
Southern Colfax Avenue Alignment/Stafford Site Drive #3 (Intersection #9)	Eastbound Right	50-foot storage plus 150-foot taper
	Eastbound Left	250-foot storage plus 150-foot taper
	Westbound Right	75-foot storage plus 150-foot taper
	Westbound Left	Volume does not meet threshold
Picadilly Road/Stafford Site Drive #4 (Intersection #11)	Northbound Right	Volume does not meet threshold
Stephen D. Hogan/Lisbon Street (Site Drive) (Intersection #15)	Eastbound Left	175-foot storage plus 150-foot taper
	Westbound Right	125-foot storage plus 150-foot taper

¹Dual turn lane, storage value is per plane

While the Southern Colfax Avenue Alignment/Stafford Site Drive #3 intersection westbound approach does not meet SHAC criteria for warranting a left turn lane, one is recommended to keep turning vehicles from queuing into the through lane. A 50-foot storage plus 150-foot taper is recommended for that movement.

Colfax Progression Analysis

CDOT requested a progression analysis of Colfax Avenue to determine if signal progression is satisfactory given the reduction of signal spacing from 1/2 mile spacing to as low as 1/3 mile spacing near the main site entrance on Lisbon Street. Progression was analyzed for the four signals between Dunkirk Street and Picadilly Road. The analysis used a projected cycle length of 120 seconds and the existing 55 MPH speed limit.

Eastbound

The eastbound progression was analyzed from Dunkirk Street through movements to the Picadilly Road eastbound left turn movement for traffic heading towards the new I-70 interchange. The AM eastbound progression achieves a bandwidth of 39 seconds, representing the entire eastbound green time at the Picadilly Road/Colfax Avenue intersection for an efficiency of 32.5 percent. The PM peak hour progression in the dominant eastbound direction achieves a bandwidth of 37 seconds for an efficiency of 30.8 percent.

Westbound

The westbound progression considered both the northbound lefts from Picadilly Road and through movements beginning at Lisbon Street. This consideration is to account for the fact that the northbound left volumes do not warrant progressing a bandwidth from the tee intersection at Picadilly Road west that would satisfy SHAC recommendations due to heavy north-south volumes that are also of concern given that Picadilly Road is a planned major arterial roadway. Progression percentages presented are from Lisbon Street west. The AM peak hour progression in the dominant westbound direction finds that the entire 25 seconds of northbound left green time at Picadilly Road/Colfax Avenue intersection can progress through the remaining three study area signals. Progression from Lisbon Street west indicated that a bandwidth of 36 seconds could be progressed through the remaining two signals, which provides an efficiency of 30 percent. The PM peak hour progression in the westbound direction finds that the entire 27 seconds of northbound left green time at Picadilly Road/Colfax Avenue intersection can progress through the remaining three study area signals. Progression from Lisbon Street west was determined to be a bandwidth of 32 seconds of green time and could be progressed through the remaining two signals, which provides an efficiency of 26.7 percent.

The average progression for both directions (eastbound for the entire corridor and westbound from Lisbon Street) is 31.8 percent in the AM peak hour and 28.8 percent in the PM peak hour. While these progression efficiencies fall slightly below the 35 percent guideline from the SHAC, it should be considered that this is anticipated to be an urban environment and Picadilly Road will be a six-lane arterial that will require substantial split time to operate efficiently. The entire northbound left from Picadilly Road progresses through the entire corridor in both peak hours and the entire eastbound left progresses through the intersection at Picadilly Road for the AM peak hour. Traffic conditions along Picadilly Road are the limiting factor in not achieving the preferred 35 percent outlined in the SHAC. The proposed 1/3 mile signal spacing allows optimal progression as constrained by the Colfax Avenue/Picadilly Road intersection, and lane geometry can be implemented to accommodate projected queues without hindering traffic flow at adjacent signals. Progression diagrams are presented in **Appendix I**.

V. SUMMARY AND RECOMMENDATIONS

NorthPoint Development is proposing a 350-acre development consisting of approximately 4.2 million square feet of industrial uses, approximately 160,000 square feet of mixed retail including a bank and supermarket, a gas station, and two hotels with a total of 200 rooms. The development will be phased as the market allows, and the initial development phase includes development of three buildings along the northern end of the industrial park portions of the site. These three buildings will provide approximately 2.2 million square feet of space with about half being dedicated to a large single user fulfilment center. Primary access to the site will be via Colfax Avenue, particularly through initial development. As the property develops, an internal road system will evolve providing circulation around the site as well as providing access onto Colfax Avenue, Picadilly Road (which will ultimately interchange with I-70), and Stephen D. Hogan Parkway.

The proposed Stafford development is estimated to generate approximately 19,600 external trips per day when built out, with about 2,100 occurring during the AM peak hour and 2,900 occurring during the PM peak hour. Phase I of the development will generate approximately 5,400 daily trips, with about 2,100 occurring during the AM peak hour and 2,900 occurring during the PM peak hour.

The potential traffic impacts of the development were evaluated under both short-term future (2022) and long-term future (2040) conditions. The 2022 conditions include the development's first phase, of all industrial park buildings, with relatively little other development in the area. The long-term analysis reflects buildup of Stafford and the surrounding area per travel demand modeling represented in the I-70/Picadilly Road interchange study, which accounts for a full interchange at I-70/Picadilly Road as well as the continuity of Picadilly Road north of Colfax Avenue, across I-70, and connecting with Picadilly Road at Smith Road.

NorthPoint does not intend to develop any of the retail portions of the Stafford Logistics Center prior to the realignment of Picadilly Road. The retail uses will develop once more residential development in the area occurs, which is not expected to mature to the point that Picadilly Road requires widening in short-term scenarios.

Short-term future needs in the area to accommodate Phase I of the Stafford development include the following:

- Providing auxiliary left and right turn lanes and signalization of the Colfax Avenue/Lisbon Street (Stafford full access drive)
- Providing an auxiliary right turn lane at the Colfax Avenue/Stafford Access Drive #1
- Realigning Picadilly Road simultaneously with construction of the large single user fulfilment center and the signalization of the new Colfax Avenue/Picadilly Road at that time.

Long-term future (2040) traffic reflects buildup of the area, and traffic volumes are anticipated to increase noticeably. The following roadway sections are needed to accommodate future traffic.

- Colfax Avenue will be realigned to the southeast of Picadilly Road and is projected to need a four-lane cross section.
- Picadilly Road will be continued to the north providing an interchange with I-70 and is projected to need a six-lane cross section.
- The intersections of Colfax Avenue/Himalaya Street, Colfax Avenue/Lisbon Street, Colfax Avenue/Picadilly Road, Picadilly Road/Realigned Southern Colfax Avenue alignment, and Realigned Southern Colfax Avenue alignment/Stafford Access Drive #3 are all projected to be signalized. CDOT will not allow the signalization of Colfax Avenue/Espana Street.

- The internal site intersections of Lisbon Street/13th Avenue will be all-way stop controlled.
- The average progression for both directions is 31.8 percent in the AM peak hour and 28.8 percent in the PM peak hour. Traffic conditions along Picadilly Road are the limiting factor in not achieving the desired progression levels outlined in the SHAC and not the placement of signals at intervals below 1/2 mile along Colfax Avenue.

The City of Aurora bases the need for auxiliary turn lanes on the CDOT SHAC (and Colfax Avenue being a state highway already requires the SHAC's application). Ultimate turn lane storage lengths are shown in **Table 3** for auxiliary lanes at site access points.

These improvements have been developed based on the current understanding of the I-70/Picadilly Road interchange project. It is acknowledged that results of the interchange project study may provide additional recommendations at arterial intersections in the study area.

¹Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

²Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

³Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

⁴Enter vehicle occupancy assumed in Table 1-A vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made to Tables 5-A, 9-A (O and D). Enter transit, non-motorized percentages that will result with proposed mixed-use project complete.

⁵Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-A.

⁶Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

HCM 6th LOS			A									

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

HCM 6th LOS				B								

Notes

User approved pedestrian interval to be less than phase max green.

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Long-Term Background Traffic Four-Hour Vehicular Volume (70% Factor)
(Community Less than 10,000 Population or Above 40 mph On Major Street)

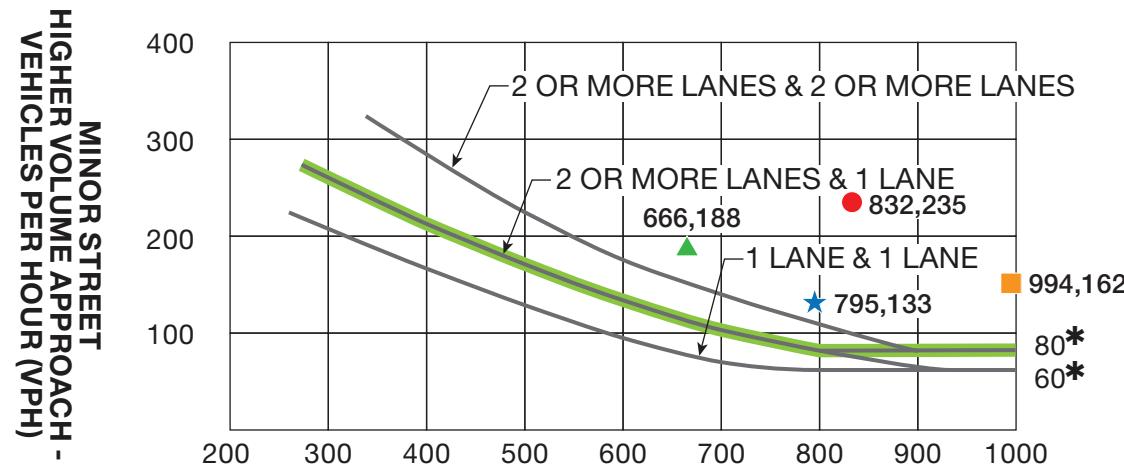

WARRANT 3: Colfax Avenue/Himalaya Street
Long-Term Background Traffic Peak Hour (70% Factor)
(Community Less than 10,000 Population or Above 40 mph On Major Street)

WARRANT 2: Colfax Avenue/Site Driveway #3
Long-Term Total Traffic Four-Hour Vehicular Volume

WARRANT 3: Colfax Avenue/Site Driveway #3
Long-Term Total Traffic Peak Hour

WARRANT 2: Stephen D. Hogan Parkway/Lisbon Street
Long-Term Total Traffic Four-Hour Vehicular Volume

WARRANT 3: Stephen D. Hogan Parkway/Lisbon Street
Long-Term Total Traffic Peak Hour

MAJOR STREET - TOTAL OF BOTH APPROACHES - VEHICLES PER HOUR (VPH)

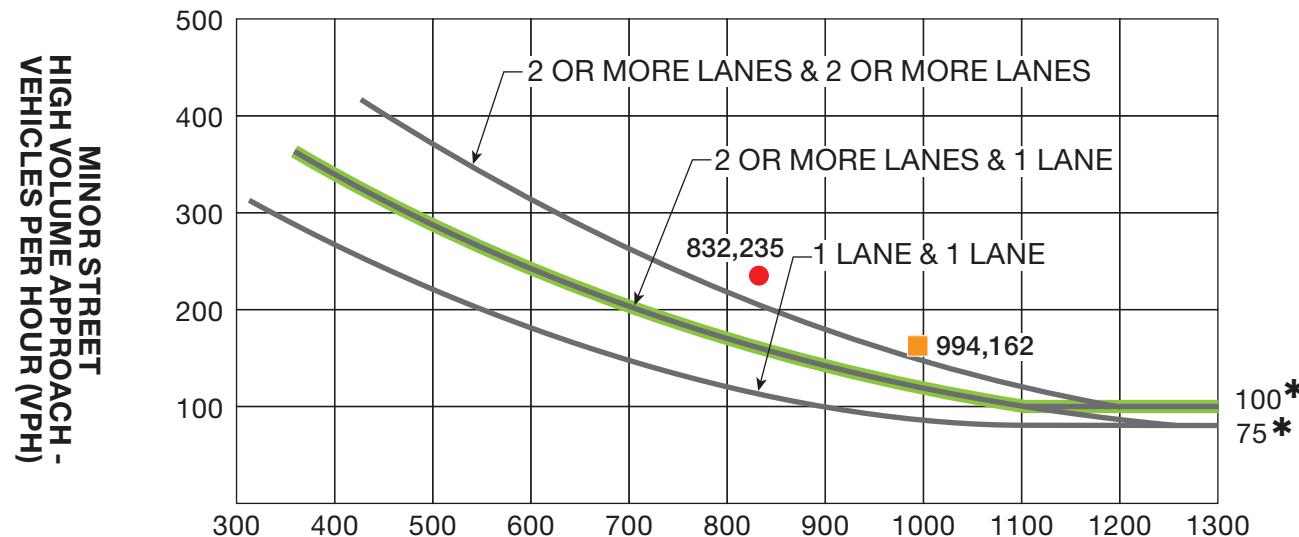

* Note: 80 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 60 vph applies as the lower threshold volume for a minor street approach with one lane.

LEGEND

- = AM Peak Hour
- = PM Peak Hour
- ▲ = 80% AM Peak Hour
- ★ = 80% PM Peak Hour

WARRANT 2

Colfax Ave/I-70 Frontage Rd
Existing Four-Hour Vehicular Volume (70% Factor)
 (Community Less than 10,000 Population or Above 40 mph On Major Street)

MAJOR STREET - TOTAL OF BOTH APPROACHES - VEHICLES PER HOUR (VPH)

* Note: 100 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor street approach with one lane.

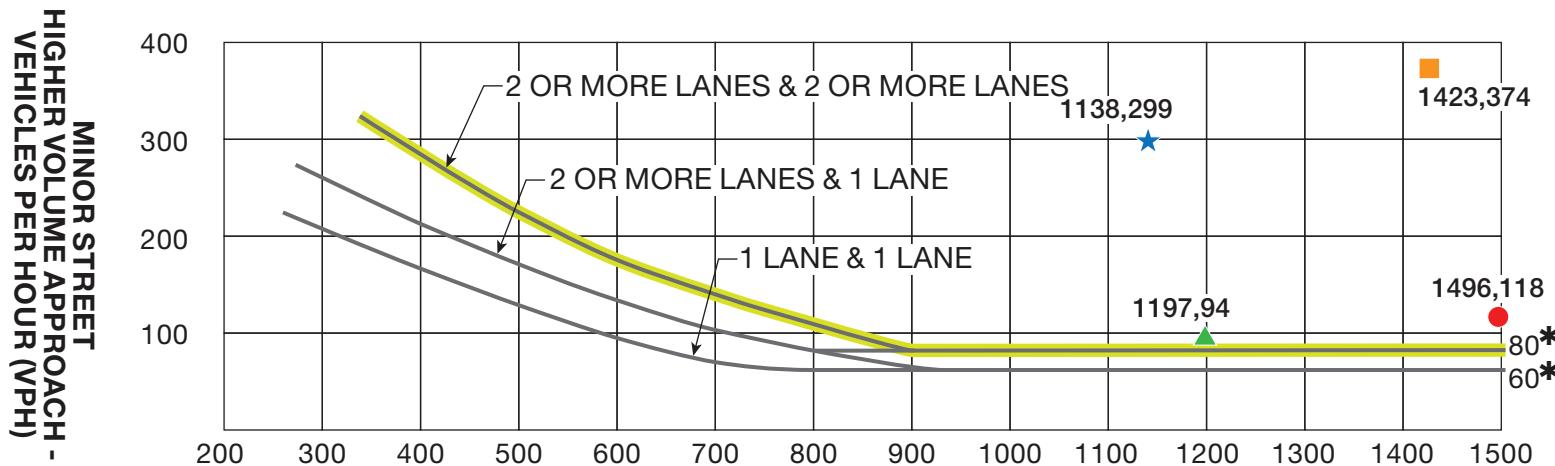

LEGEND

- = AM Peak Hour
- = PM Peak Hour

WARRANT 3

**Colfax Ave/I-70 Frontage Rd
Existing Peak Hour (70% Factor)**

(Community Less than 10,000 Population or Above 40 mph On Major Street)

MAJOR STREET - TOTAL OF BOTH APPROACHES - VEHICLES PER HOUR (VPH)

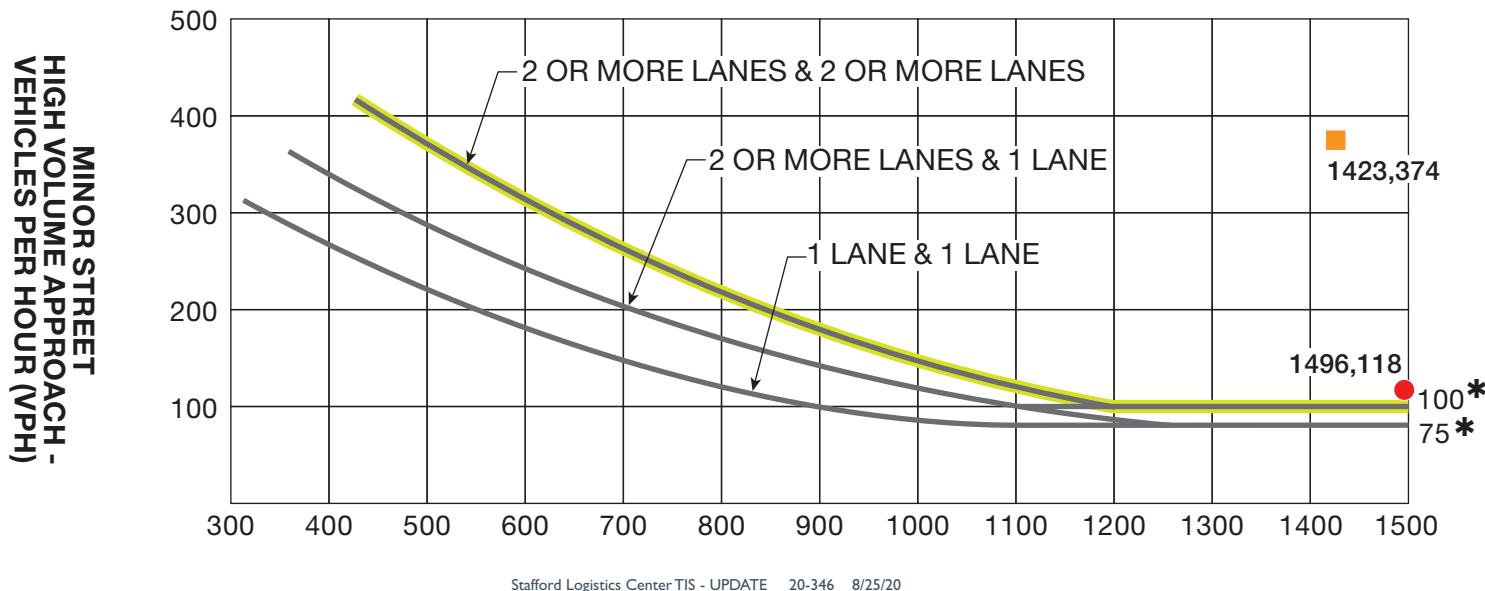

* Note: 80 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 60 vph applies as the lower threshold volume for a minor street approach with one lane.

LEGEND

- = AM Peak Hour
- = PM Peak Hour
- ▲ = 80% of PM Peak Hour
- ★ = 80% of PM Peak Hour

WARRANT 2

**US 40/Colfax Ave. & Lisbon St. Short-Term Total Traffic
Four-Hour Vehicular Volume (70% Factor)**
(Community Less than 10,000 Population or Above 40 mph On Major Street)

MAJOR STREET - TOTAL OF BOTH APPROACHES - VEHICLES PER HOUR (VPH)

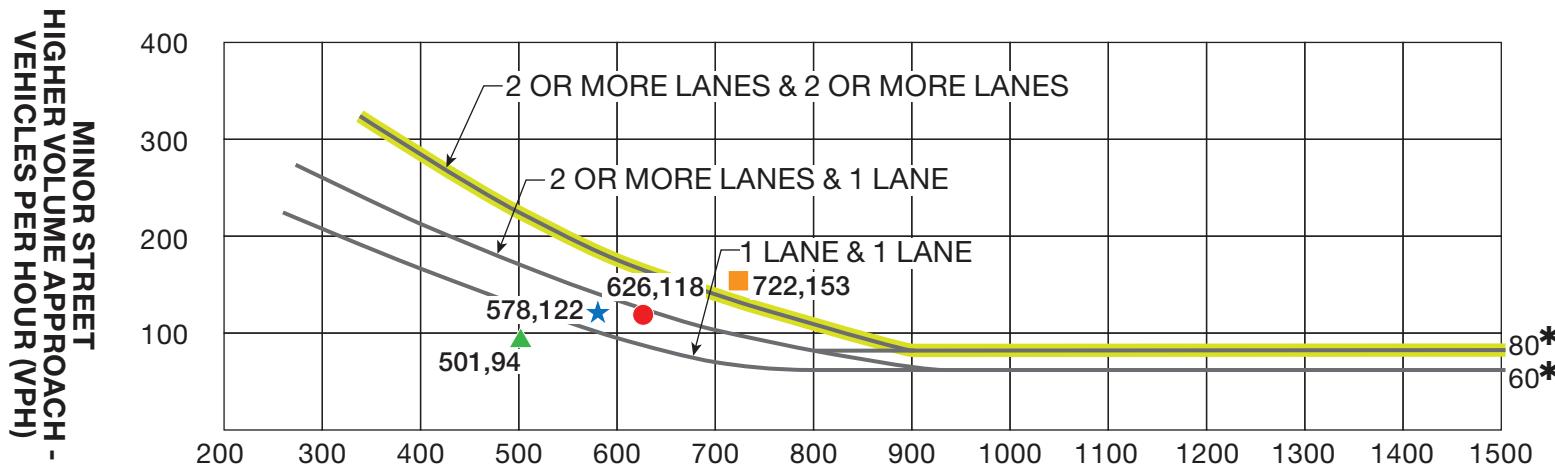

* Note: 100 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor street approach with one lane.

LEGEND

- = AM Peak Hour
- = PM Peak Hour

WARRANT 3

**US 40/Colfax Ave. & Lisbon St. Short-Term Total Traffic Scenario 3
Short-Term Peak Hour (70% Factor)**
(Community Less than 10,000 Population or Above 40 mph On Major Street)

MAJOR STREET - TOTAL OF BOTH APPROACHES - VEHICLES PER HOUR (VPH)

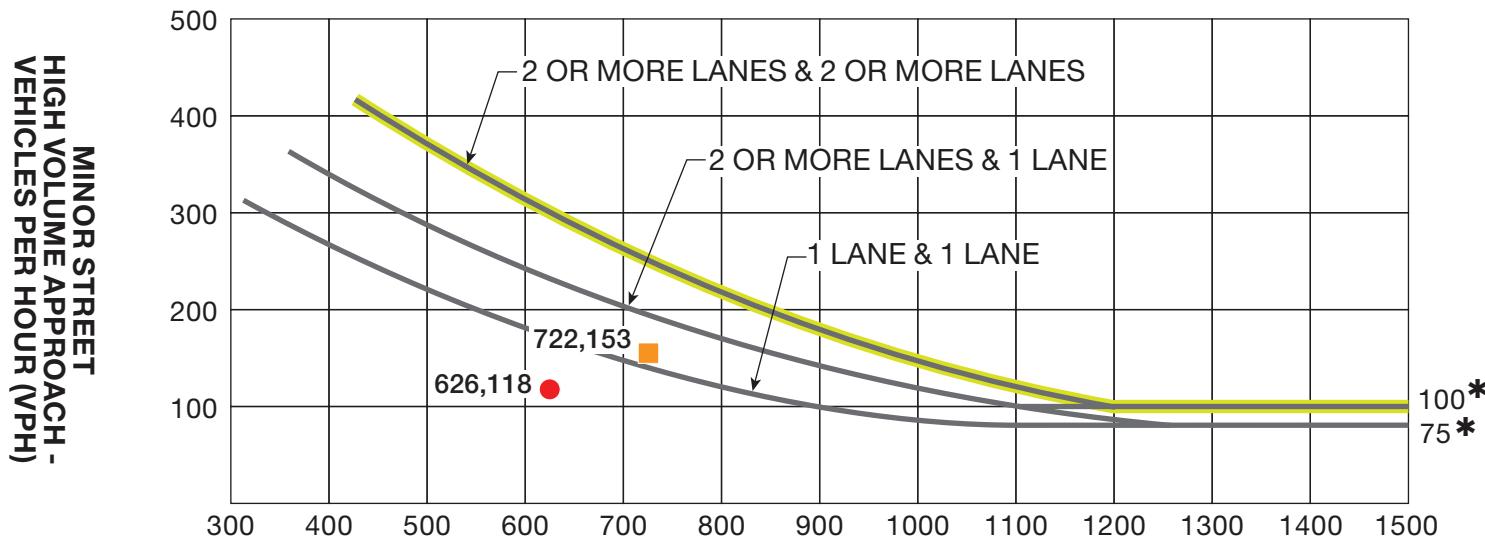

* Note: 80 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 60 vph applies as the lower threshold volume for a minor street approach with one lane.

LEGEND

- = AM Peak Hour
- = PM Peak Hour
- ▲ = 80% of AM Peak Hour
- ★ = 80% of PM Peak Hour

WARRANT 2

**Realigned Colfax Ave. & Picadilly Rd. Short-Term Total Traffic
Four-Hour Vehicular Volume (70% Factor)**
(Community Less than 10,000 Population or Above 40 mph On Major Street)

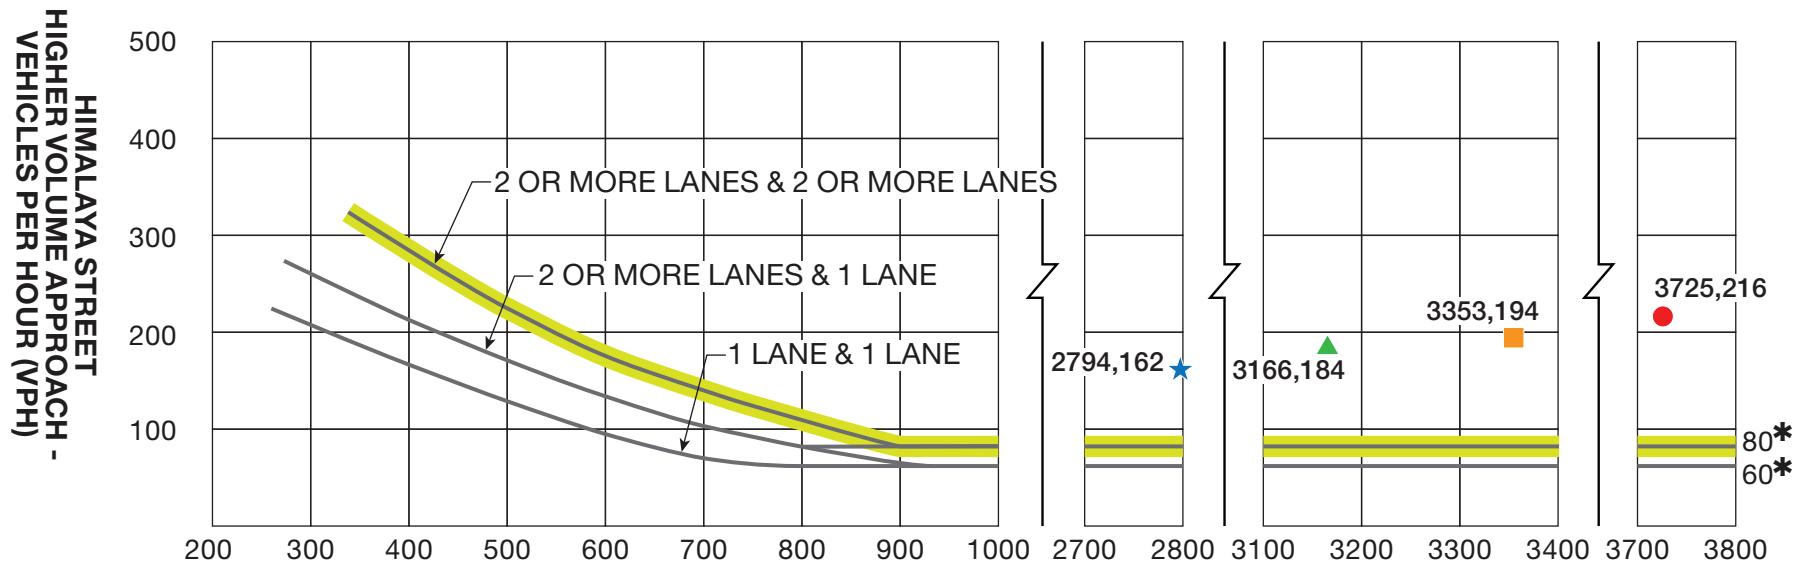

LEGEND

- = AM Peak Hour
- = PM Peak Hour

WARRANT 3

**Realigned Colfax Ave. & Picadilly Rd. Short-Term Total Traffic Scenario 3
Short-Term Peak Hour (70% Factor)**
(Community Less than 10,000 Population or Above 40 mph On Major Street)

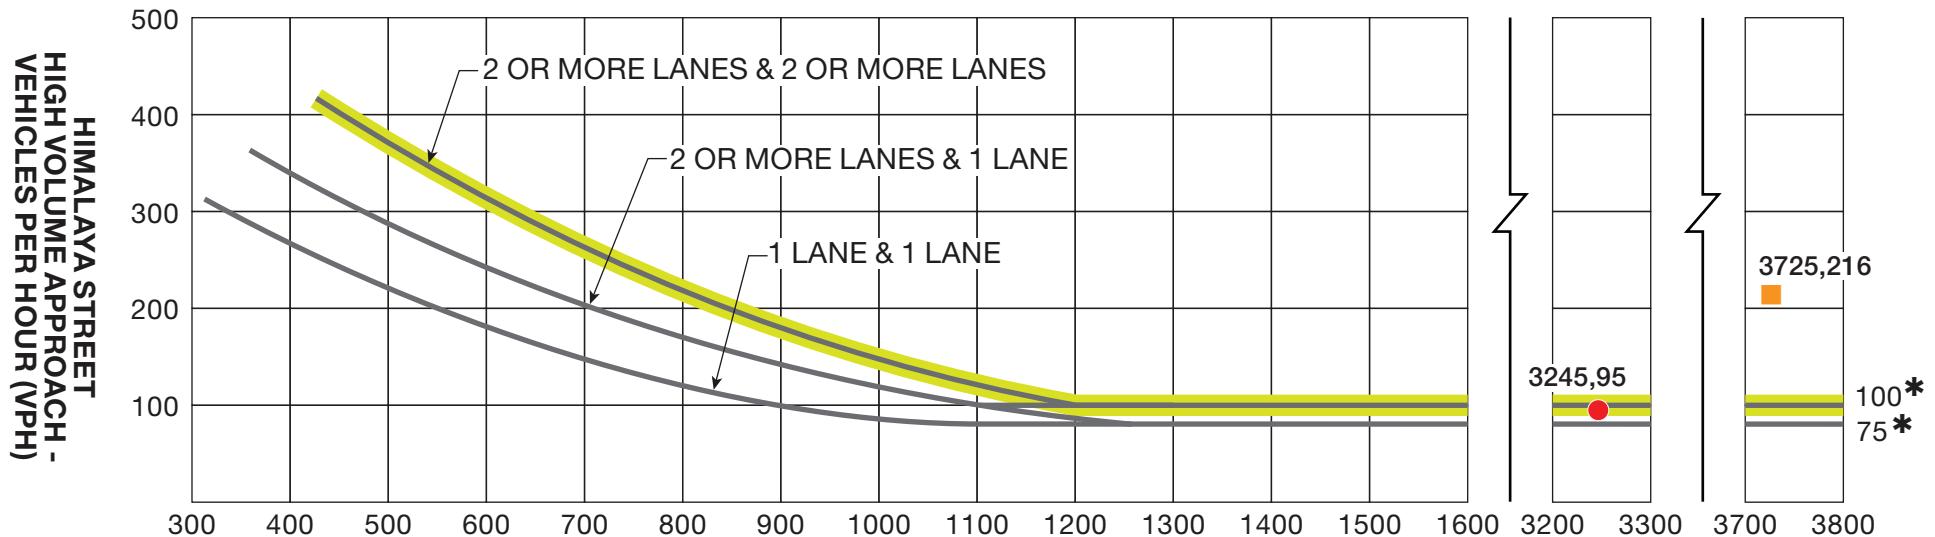

* Note: 80 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 60 vph applies as the lower threshold volume for a minor street approach with one lane.

LEGEND

- = PM Peak Hour
- = 90% PM Peak Hour
- ▲ = 85% PM Peak Hour
