I. INTRODUCTION

Velocity Development is proposing to develop an approximately 155-acre site within the Port Colorado Master Plan area, previously the Transport development area. The PA 13 site is located in the northwest quadrant of the future intersection of 32nd Avenue and Cavanaugh Road in Aurora, Colorado. **Figure 1** illustrates the location of the site and the adjacent primary roadway network (existing and future planned roadways).

The proposed industrial development would consist of approximately 2.2 million square feet of distribution center buildings and approximately 32,000 square feet of amenity space. Primary access to the site will be provided onto 32nd Avenue along the south side of the site and Cavanaugh Street east of the site. **Figure 2** depicts the current site plan depicting building locations and site access points.

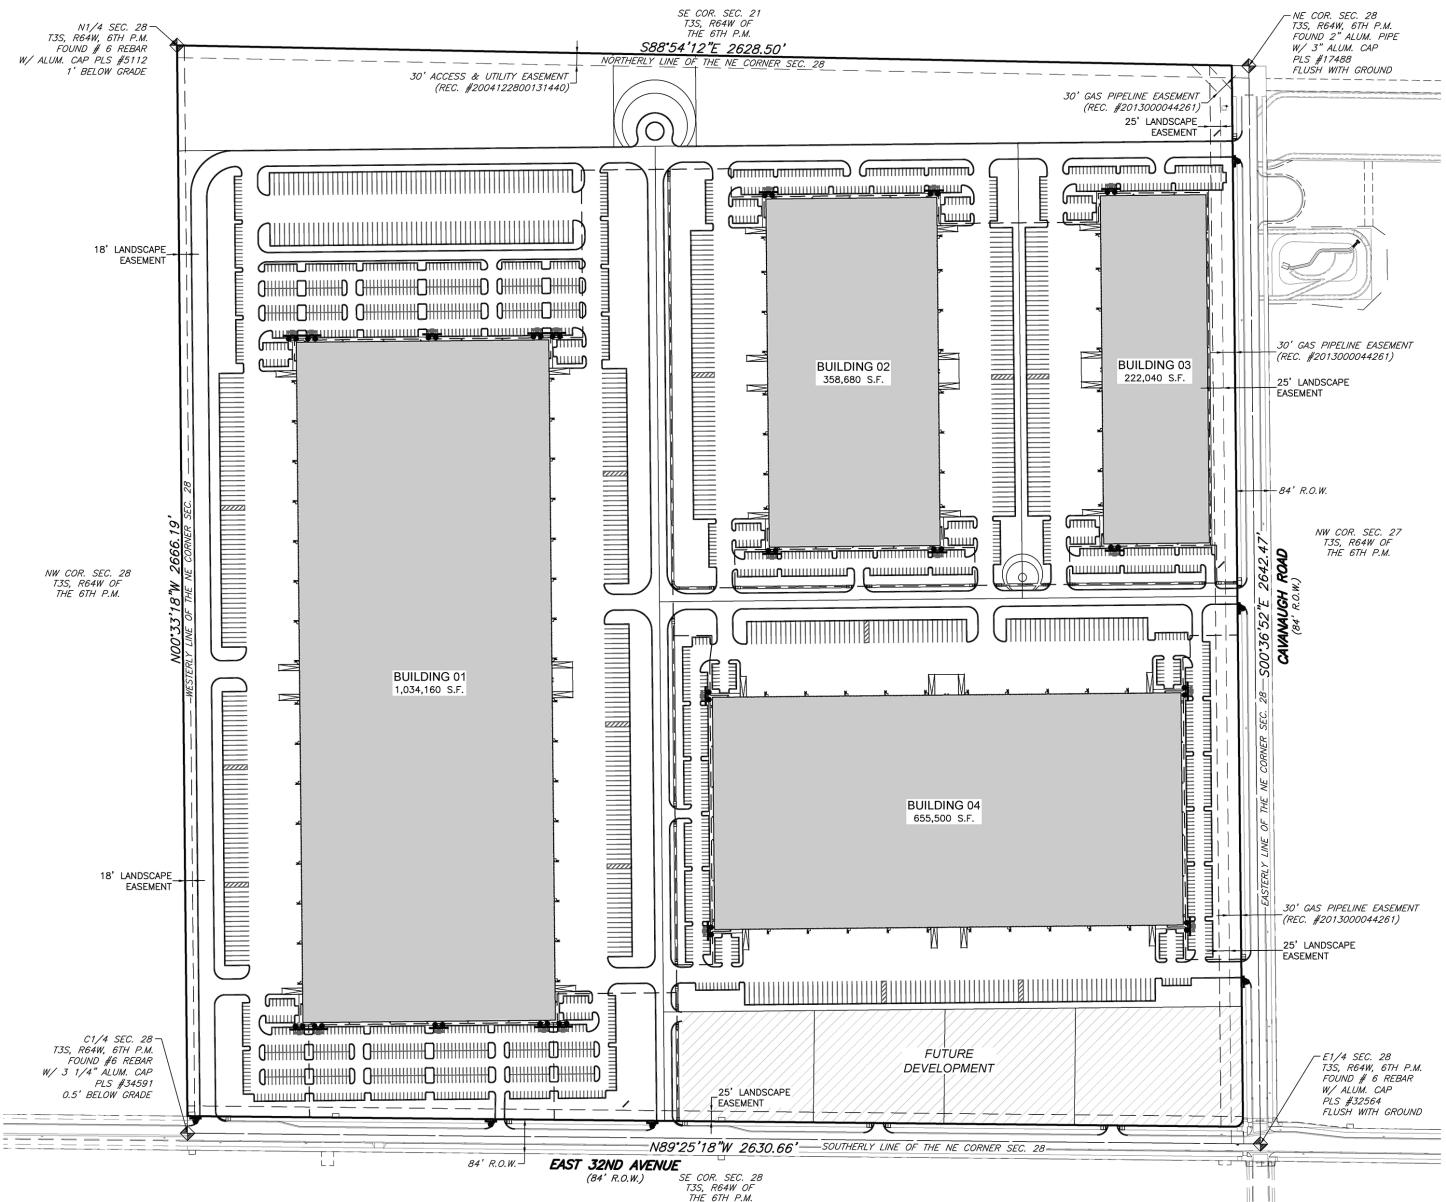

The purpose of this Transportation Impact Study (TIS) is to estimate the potential impacts specific to the proposed development and to identify any resultant required roadway and/or intersection improvements and traffic control needs. A short-term scenario representing completion of the site in year 2026 was analyzed. Similarly, a long-term future scenario was explored to examine traffic impacts within the context of the buildup of the site, sometime beyond year 2040. An existing conditions analysis has been omitted as Manilla Road is the only study area roadway that currently exists, and no study area intersections currently exist. An existing conditions analysis for the surrounding area was conducted in the Framework Development Plan (FDP) Study in 2020.

This study builds on the *Transport Colorado Master Plan Traffic Impact Study Analysis*, April 2020, prepared by Felsburg Holt & Ullevig, with updates to anticipated land uses and quantities. This study addresses transportation needs of the 5,378-acre Port Colorado FDP.

LEGEND

- = Current Roadways
- - - = Future Roadways

II. EXISTING CONDITIONS

II.A. Surrounding Land Use

The area around the Port Colorado FDP is mostly vacant. The Front Range Airport is located to the north and east of the site. Denver International Airport (DEN) is located northwest of the FDP.

II.B. Roadway System

Very few roadways exist in proximity to the site. One notable roadway, Manilla Road, runs north-south and defines part of the overall FDP's eastern boundary. Manilla Road has a posted speed of 45 miles per hour (mph) near the site. Additional widening is planned to establish a four-lane roadway between 48th Avenue and the interchange at I-70. Timing of the improvement is highly dependent on development within Port Colorado. The Subarea I analysis of the master TIS identified the need for this improvement once approximately 700 acres of the site are developed, estimated to occur in a 10- to 15-year timeline as identified in Table 5 of that report.

I-70 exists south of the site, but site access to I-70 is approximately 2.5 miles away to the southeast at the Manilla Road interchange. I-70 has a posted speed of 75 mph adjacent to the study area.

Colfax Avenue (US-36) also exists approximately 1.5 miles away to the south. Colfax Avenue has a posted speed of 55 mph near the site.

II.C. Traffic Volumes

Past data collected for the master study along Manilla Road in September 2018 indicate that approximately 350 vehicles per day (VPD) travel Manilla Road north of Colfax Avenue today. Due to the lack of additional development in the area, new data were not collected as it was believed that traffic in the vicinity of the site would not have experienced significant changes over the course of the last three years. Traffic data can be found on Figure 3 and in Appendix A of the master TIS.

III. PROPOSED CONDITIONS

III.A. Future Road Network

In 2018, the City of Aurora completed the NEATS Refresh study, which provides Year 2040 and regional buildout transportation recommendations for the roadways and a multimodal transportation system. The NEATS Refresh study area encompassed a regional area extending from approximately between Tower Road east to Schumaker Road, and from Jewell Avenue on the south to 72nd Avenue on the north. Recommendations with respect to Port Colorado included:

- Constructing a new interchange with I-70 at Quail Run Road. The Port Colorado Team has recently initiated the 1601 process to permit the new interchange. It is anticipated that the construction of an interchange will occur in a 5- to 10-year timeline.
- Constructing a diagonal connection between Imboden Road and Quail Run as a four-lane arterial as defined by NEATS. The Port Colorado FDP TIS identified the need for this segment to have an ultimate 6-lane cross-section. Construction of this diagonal connection will likely coincide with the Quail Run Road interchange project.

In the short term (2026), 32nd Avenue will have only emergency access connectivity to the west. The long term year is an undefined year past 2040 that includes full regional buildout as well as full buildout of the Port Colorado development. 32nd Avenue will provide the main points of access for the site and will ultimately continue as a three-lane collector between Quail Run Drive and Manilla Road.

32nd Avenue is currently being constructed east to west beginning at Manilla Road with the initial phase terminating at Quail Run Drive, approximately one-half mile beyond the site's western boundary.

Cavanaugh Road will also be constructed as a three-lane collector between 32nd and 48th Avenues with the initial phase being built immediately adjacent to the site.

III.B. Site Trip Generation

The current proposed industrial development will consist of approximately 2.2 million square feet of distribution center buildings and approximately 32,000 square feet of amenity space. The FDP master plan traffic study had contemplated approximately 1 million square feet of light industrial space for PA 13. Trip generation estimates were developed using weekday data contained in *Trip Generation*, 10th Edition, Institute of Transportation Engineers (ITE), 2017. The Port Colorado FDP Traffic Impact Study has estimated a generation of approximately 3,900 trips per day. **Table I** shows the trip generation for the proposed development, which is estimated to generate 3,444 trips per day when built out, equating to roughly 12 percent less trip generation as compared to estimates made in the Port Colorado FDP Traffic Impact Study.

Table I. Trip Generation Summary

| Land Use | Intensity | ITE Code | Daily Trips | AM Peak Hour | | | PM Peak Hour | | | |
|--|-----------|----------|-------------|--------------|------------|-----------|--------------|-----------|------------|------------|
| | | | | In | Out | Total | In | Out | Total | |
| High-Cube Transload and Short-Term Storage Warehouse | 2,237 KSF | 154 | 3,132 | 138 | 41 | 179 | 63 | 161 | 224 | |
| General Office | 32 KSF | 710 | 312 | 32 | 5 | 37 | 6 | 31 | 37 | |
| Grand Total | | | | 3,444 | 170 | 46 | 216 | 69 | 192 | 261 |

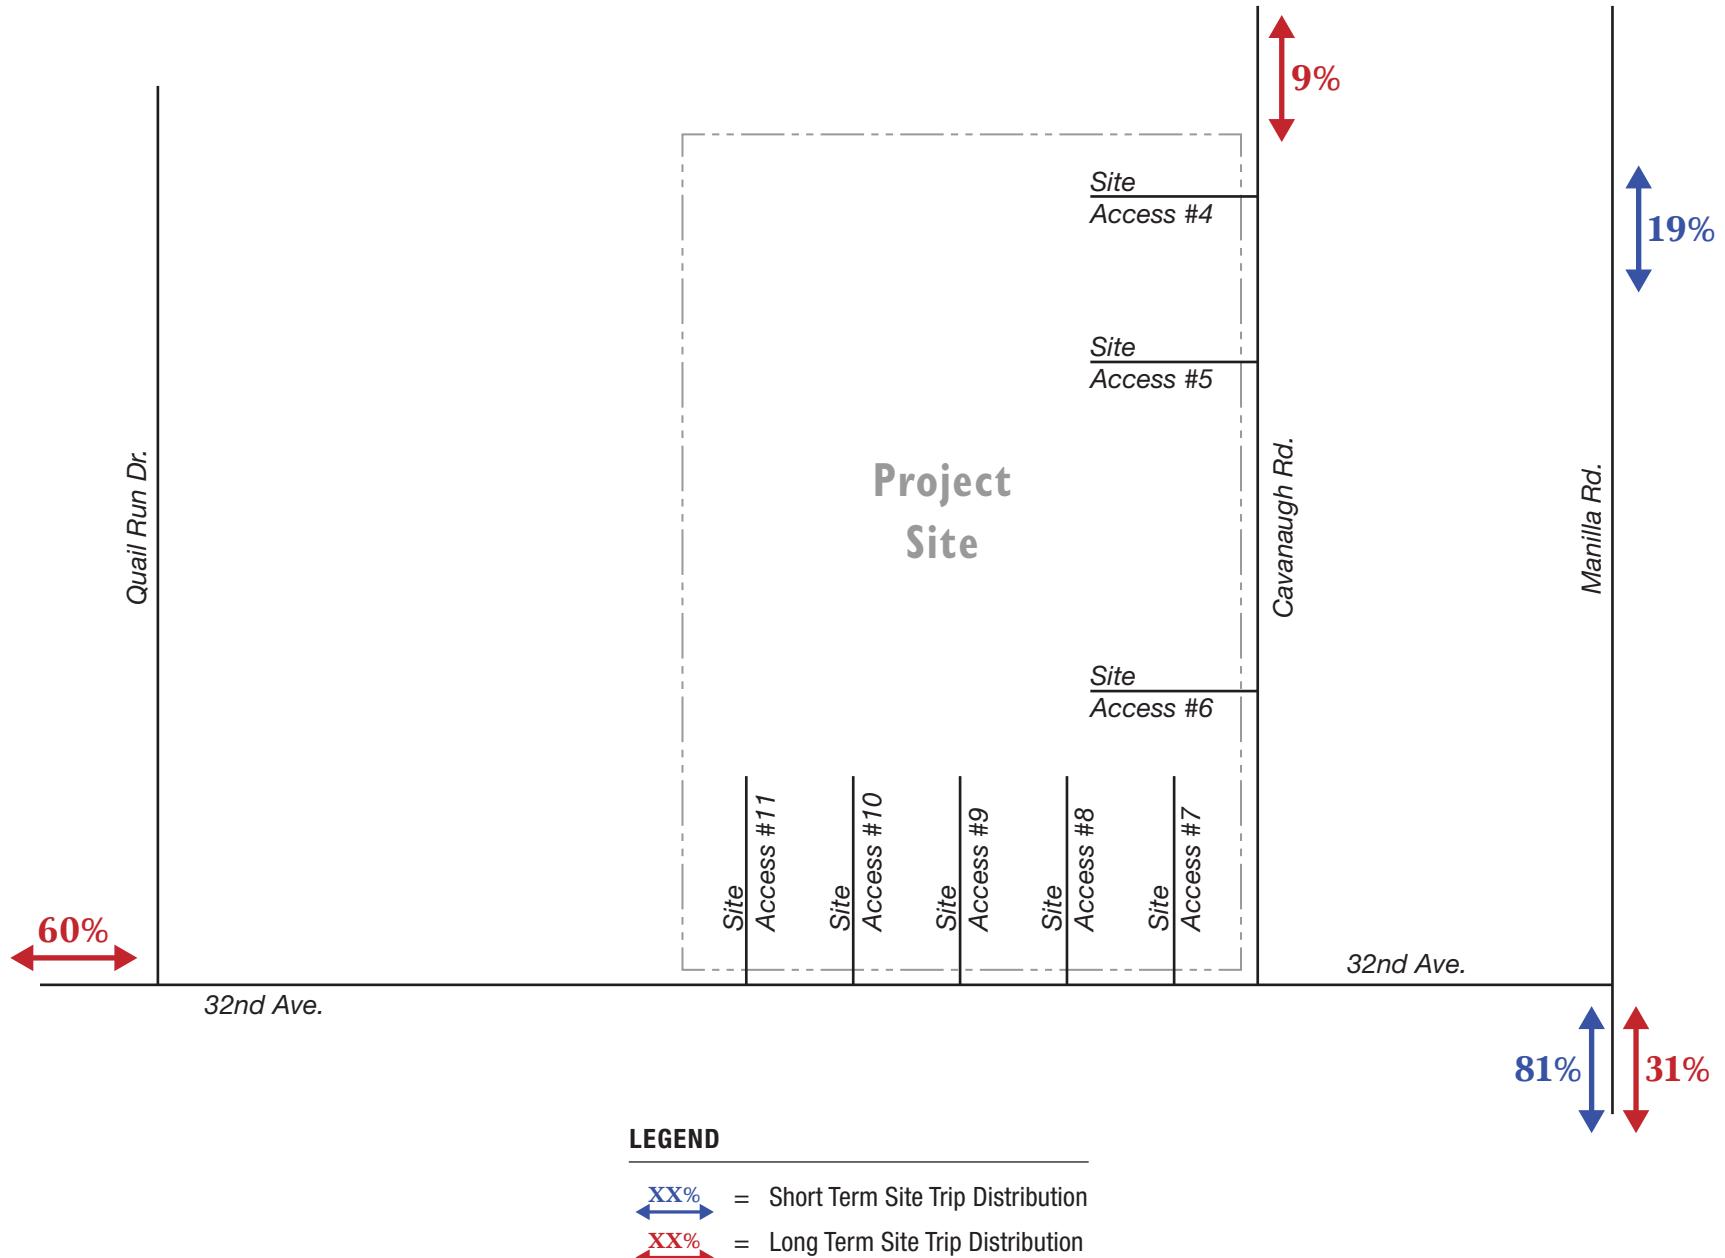

III.C. Trip Distribution and Traffic Assignment

Trip distribution estimates for this site were based on those used in the FDP master plan traffic study. The greatest component of site traffic will be toward Quail Run Drive, which will afford regional connectivity as the area's roadway network builds out including to the prosed interchange with I-70. The master TIS provides overall distributions, and trip assignments for individual parcels are made based on logical shortest paths to and from those regional destinations.

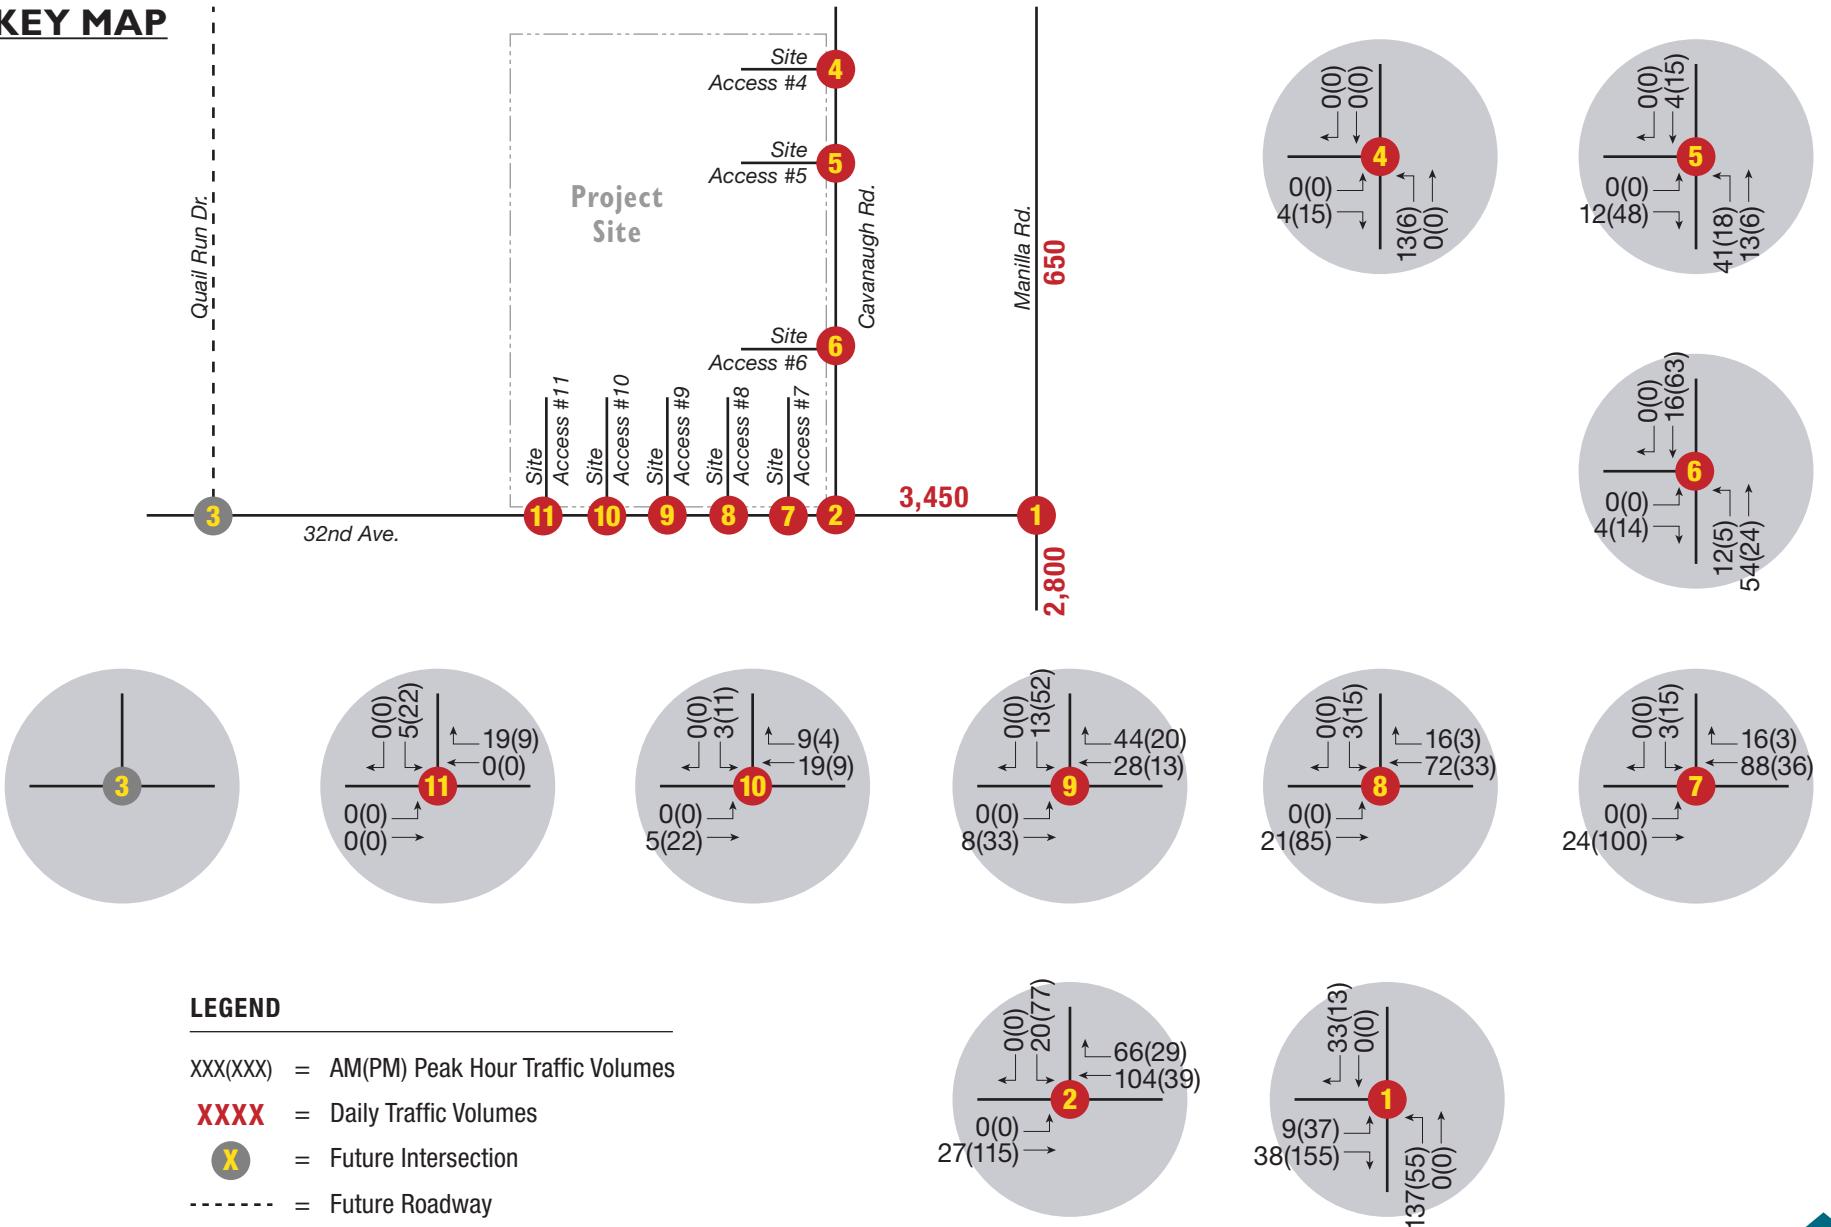

Figure 3 shows the site-trip distribution percentages for the short- and long-term scenarios. **Figure 4** shows the trip assignment for the short-term scenario in which all traffic will access the site via Manilla Road. From the traffic assignment shown on **Figure 4**, 32nd Avenue would be impacted the greatest; PA 13's buildup would add all 3,450 VPD onto 32nd Avenue in the short-term planning horizon east of the site.

Figure 5 shows the trip assignment resulting from applying the percentages for site traffic in the long-term scenario. This scenario includes the continuation of 32nd Avenue to the west and Cavanaugh Road to the north. 32nd Avenue will continue to be impacted the most by the development, which is projected to add approximately 2,100 VPD west of the site.

Relatively minor traffic amounts will be oriented to the north reflecting completion of the area's roadway system by buildup of the NEATS study area. Similar to the short-term planning horizon, 32nd Avenue would be most impacted by PA 13 trips. However, the impact is reduced compared to the short-term since additional options will be available to serve site traffic, namely the completion of Cavanaugh Road to the north to 48th Avenue and the interchange of Quail Run Road with I-70 to the southwest. The extension of Cavanaugh Road is based on adjacent development occurring and currently has no defined timeline. The interchange of Quail Run with I-70 recently initiated a 1601 process with Colorado Department of Transportation (CDOT) and an Interstate Access Request with Federal Highway Administration, with the interchange expected to be constructed in a 5- to 10-year timeline.

IV. FUTURE CONDITIONS

IV.A. Short-Term Future Background

Roadway System

Because there will be relatively little other development in the area, the roadway network will be limited. The expected roadways will include 32nd Avenue (between Quail Run Drive and Manilla Road), Cavanaugh Road (adjacent to the site only), and Manilla Road. 32nd Avenue is currently under construction adjacent to the site as part of Port Colorado ISP #1.

Traffic Volumes

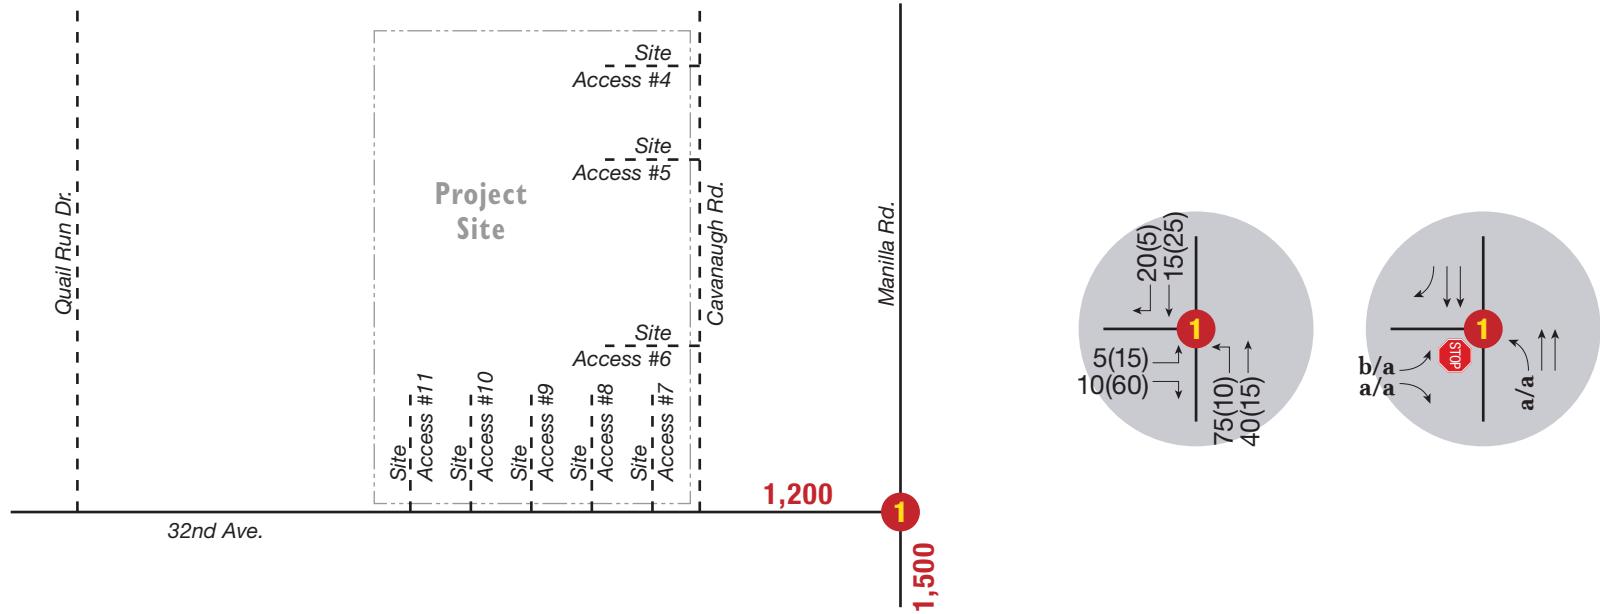

Background traffic is the component of roadway volumes that would use the adjacent roadway system regardless of site development. Components of the short-term background traffic include the development of the transload facility serving the Port Colorado and Precision Building Systems, which were explored as part of the Port Colorado ISP traffic study. **Figure 6** shows the projected short-term background traffic demands.

Traffic Control and Operations

The level of service (LOS) results and intersection laneage are included on **Figure 6**. Calculations used techniques documented in the *Highway Capacity Manual* (Transportation Research Board, 2016) using anticipated traffic volumes and intersection geometry. LOS is a qualitative measure of traffic operational conditions, based on roadway capacity and vehicle delay. Levels of service are described by a letter designation ranging from A to F, with LOS A representing almost free-flow travel, while LOS F represents congested conditions. For signalized intersections, LOS is calculated for the entire intersection while LOS for unsignalized intersections is calculated for movements that must yield right-of-way to other traffic movements.

The intersection of Manilla Road with 32nd Avenue has been assessed as a stop-controlled intersection for the short-term background scenario. Results show that the intersection would function at a LOS B or better for all movements. **Appendix B** contains the LOS Worksheets.

- = Future Roadway

IV.B. Long-Term Future Background

Roadway System

Long-term analysis for this report assumes full regional buildout. The full roadway network surrounding the site is planned to be built out, including Quail Run Drive to the west, and Cavanaugh Road will extend to 48th Avenue to the north.

Traffic Volumes

The long-term background traffic has been estimated using traffic volume projections from the *Transport Colorado Master Plan Traffic Impact Study* (assuming Port Colorado is built out) and the NEATS buildout scenario. Volumes from the two studies were combined and then trips associated with the PA 13 area, as represented in the *Transport Colorado Master Plan Traffic Study*, were removed.

Figure 7 shows the projected long-term background traffic demands along the study area roadways and intersections. Manilla Road will serve the greatest amount of long-term traffic at 22,000 VPD south of 32nd Avenue. Traffic loadings along 32nd Avenue are projected to reach 7,600 VPD west of Cavanaugh Road immediately adjacent to the site.

Traffic Control and Operations

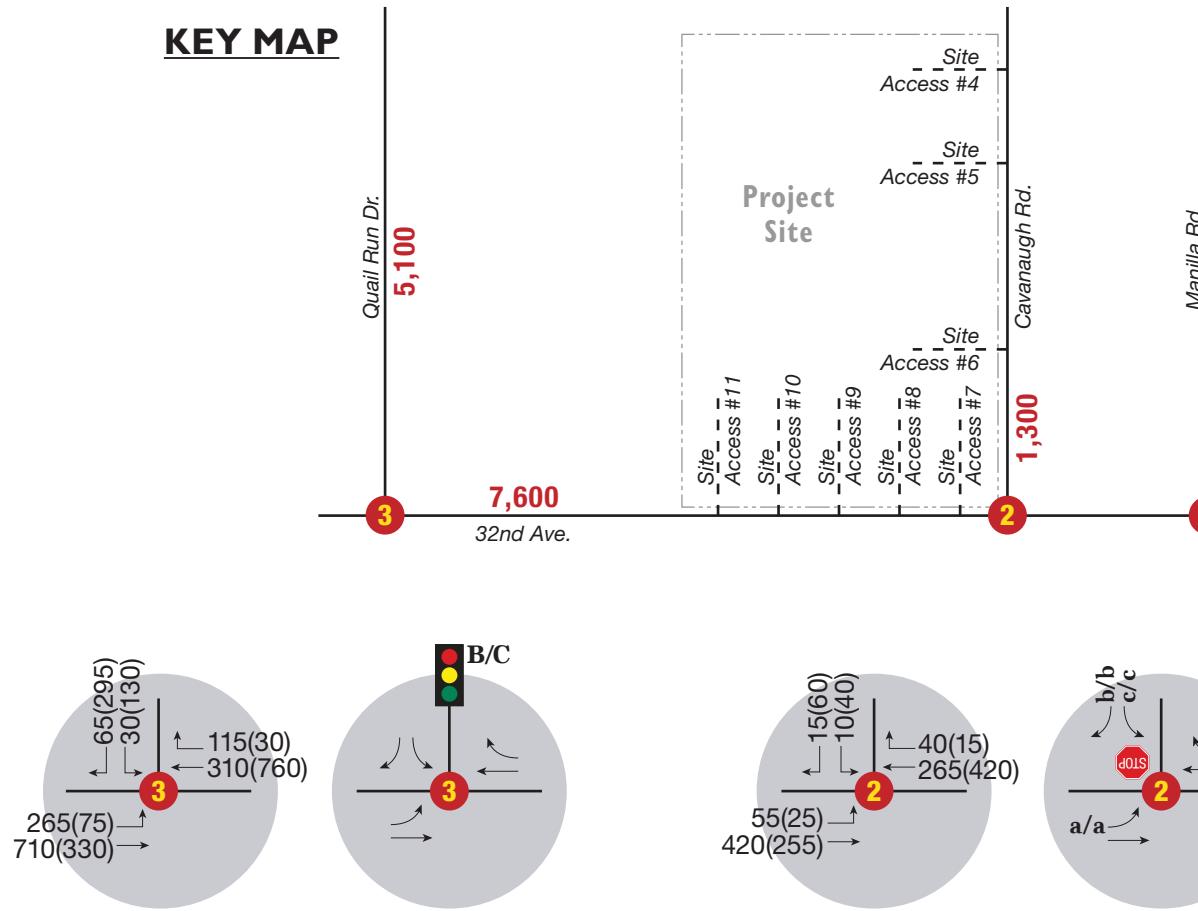

Intersection capacity analyses were conducted using the long-term background peak hour volumes as illustrated on **Figure 7**. Warrant 1 (Eight Hour Vehicular Volume), Warrant 2 (Four Hour Vehicular Volume), and Warrant 3 (Peak Hour Volume) from the MUTCD have been applied here in assessing the appropriateness for signalization at study area intersections. A factor of 57 percent has been used and applied to the peak hour traffic as a means of estimating the 8th highest hour. The 2nd through 7th highest hours were determined through linear interpolation of the peak hour and 8th highest hour traffic, which were then assessed with respect to traffic signal warrants 1 and 2. These values are based on an assumption of 10 percent of the daily volume occurring in the peak hours and a daily distribution. The procedure outlined previously provides a reasonable set of data in which to assess future signalization potential. Signalization is forecasted to be warranted at 32nd Avenue with Manilla Road and Quail Run Drive by NEATS buildout. Signal Warrant Analyses are shown in **Appendix A**.

Primary recommendations for the long-term time frame include:

- Installing traffic signals, once warranted, at 32nd Avenue/Manilla Road and 32nd Avenue/Quail Run Drive.
- Constructing dual right turn lanes on the eastbound approach at the intersection of 32nd Avenue with Manilla Road.

Figure 7 shows that the two signalized intersections will all operate at LOS C or better. The 32nd Avenue/Manilla Road intersection will require dual right turn lanes on the eastbound approach. The stop-sign controlled intersection is anticipated to operate acceptably at LOS C or better. Worksheets are presented in **Appendix B**.

IV.C. Short-Term Future Total Traffic Conditions

Roadway System

Very few roadways exist within Port Colorado at this time. In the short term, 32nd Avenue will be built out to Manilla Road to the east and Cavanaugh Road will extend north of 32nd Avenue. Additional roadways providing access to the site are also planned for the short term.

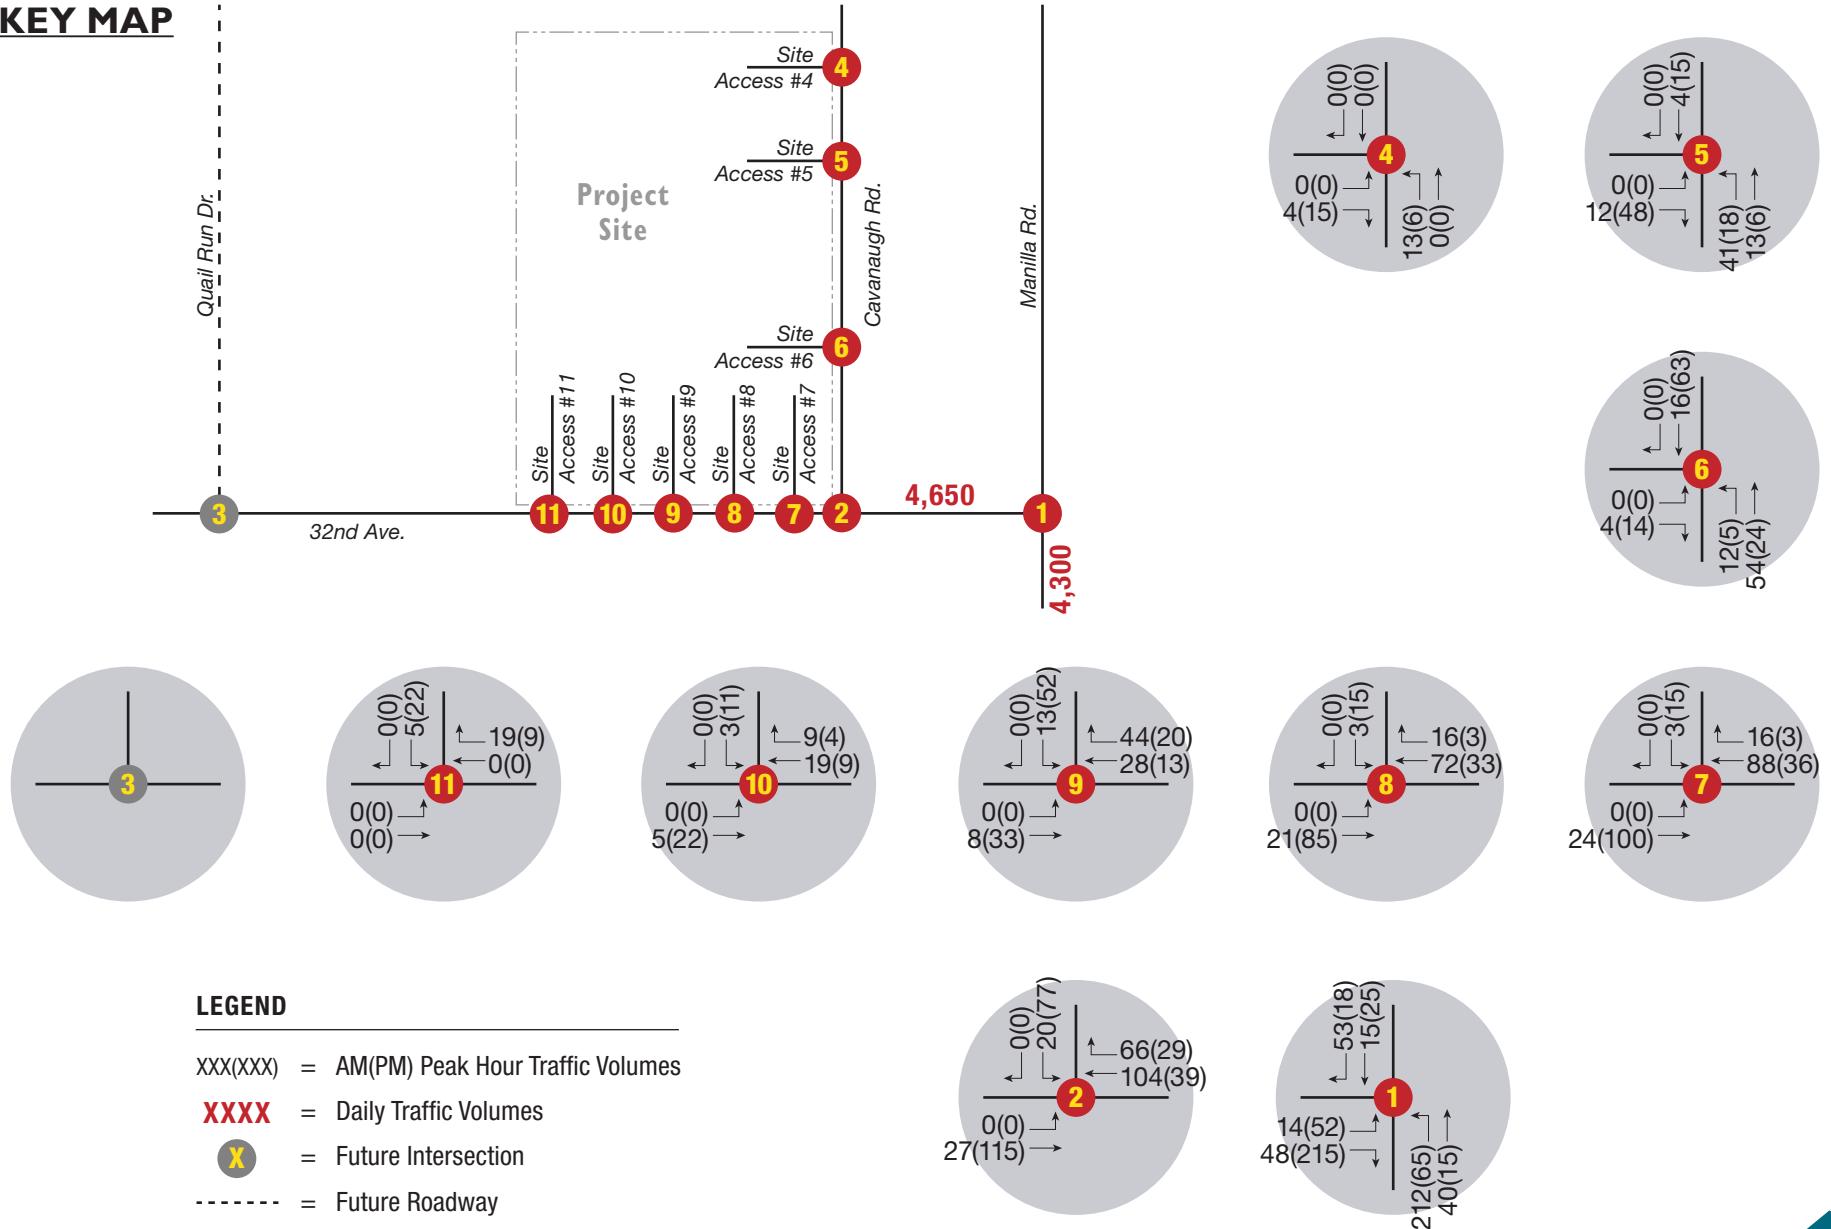

Traffic Volumes

The short-term total traffic has been estimated using the site generated traffic in combination with background traffic extracted from other nearby traffic impact studies. **Figure 8** shows the forecasted volumes of the projected short-term total traffic demands along the study area roadways and intersections. By 2026, Manilla south of 32nd Avenue is anticipated to carry 4,300 VPD, and 32nd Avenue is projected to serve a total of 4,650 VPD.

Traffic Control and Operations

The LOS results and intersection laneage are included on **Figure 9**. As illustrated, all intersections are anticipated to operate acceptably at LOS B or better assuming the addition of left and right turn lanes at all site accesses on 32nd Avenue and left turn lanes at site accesses on Cavanaugh Road. It should be noted that right turn lanes along 32nd Avenue are not anticipated to be warranted due to lack of following volume; however, they are being provided in anticipation of possible development to the west prior to completion of the Quail Run/I-70 Interchange and to provide an added level of safety for heavy vehicles entering the site. **Appendix C** includes the LOS analysis worksheets.

IV.D. Long-Term Future Total Traffic Conditions

Roadway System

The roadway network for the Port Colorado development is assumed to be built out by the full buildout of the NEATS study area sometime beyond the year 2040 for the long-term future scenario. No additional roadways are needed beyond those listed in the long-term background scenario.

Traffic Volumes

The long-term site generated traffic volumes illustrated on **Figure 5** were added to the long-term future background traffic volumes found on **Figure 7** to produce the NEATS buildout total traffic volumes shown on **Figure 10**. Manilla Road is anticipated to carry the greatest amount of total traffic estimated to be 23,000 VPD. 32nd Avenue is anticipated to carry 9,670 VPD east of Quail Run Drive.

Traffic Control and Operations

Intersection capacity analyses were conducted using the long-term total peak hour volumes as illustrated on **Figure 10**. Signalization is forecasted to be warranted at 32nd Avenue with Manilla Road and Quail Run Drive by NEATS buildout. Signal Warrant Analyses are shown in **Appendix A**.

Figure 11 shows that the two signalized intersections will all operate at LOS D or better. The 32nd Avenue/Manilla Road intersection will require dual right turn lanes on the eastbound approach. The stop-sign controlled intersections are all anticipated to operate acceptably at LOS C or better. Worksheets are presented in **Appendix C**.

Primary recommendations for the long-term time frame include:

- Installing traffic signals, once warranted, at 32nd Avenue/Manilla Road and 32nd Avenue/Quail Run Drive.
- Constructing dual right turn lanes on the eastbound approach at the intersection of 32nd Avenue with Manilla Road.
- Adding left and right turn lanes at all site accesses on 32nd Avenue and adding left turn lanes at all site accesses on Cavanaugh Road.

City of Aurora *Traffic Impact Study Guidelines* indicate that the *CDOT State Highway Access Code (SHAC)* be used to determine storage and taper lengths of auxiliary lanes. These values sometimes yield conservative results and provide storage well in excess of 95th percentile queues (which already incorporate a heavy vehicle percentage). Rather, the recommendation is that the values in **Table 2** corresponding to the 95th percentile lengths be used for storage lengths, plus a lead-in taper.

Output from the traffic analysis effort was used to recommend the storage lengths based on the following methodology:

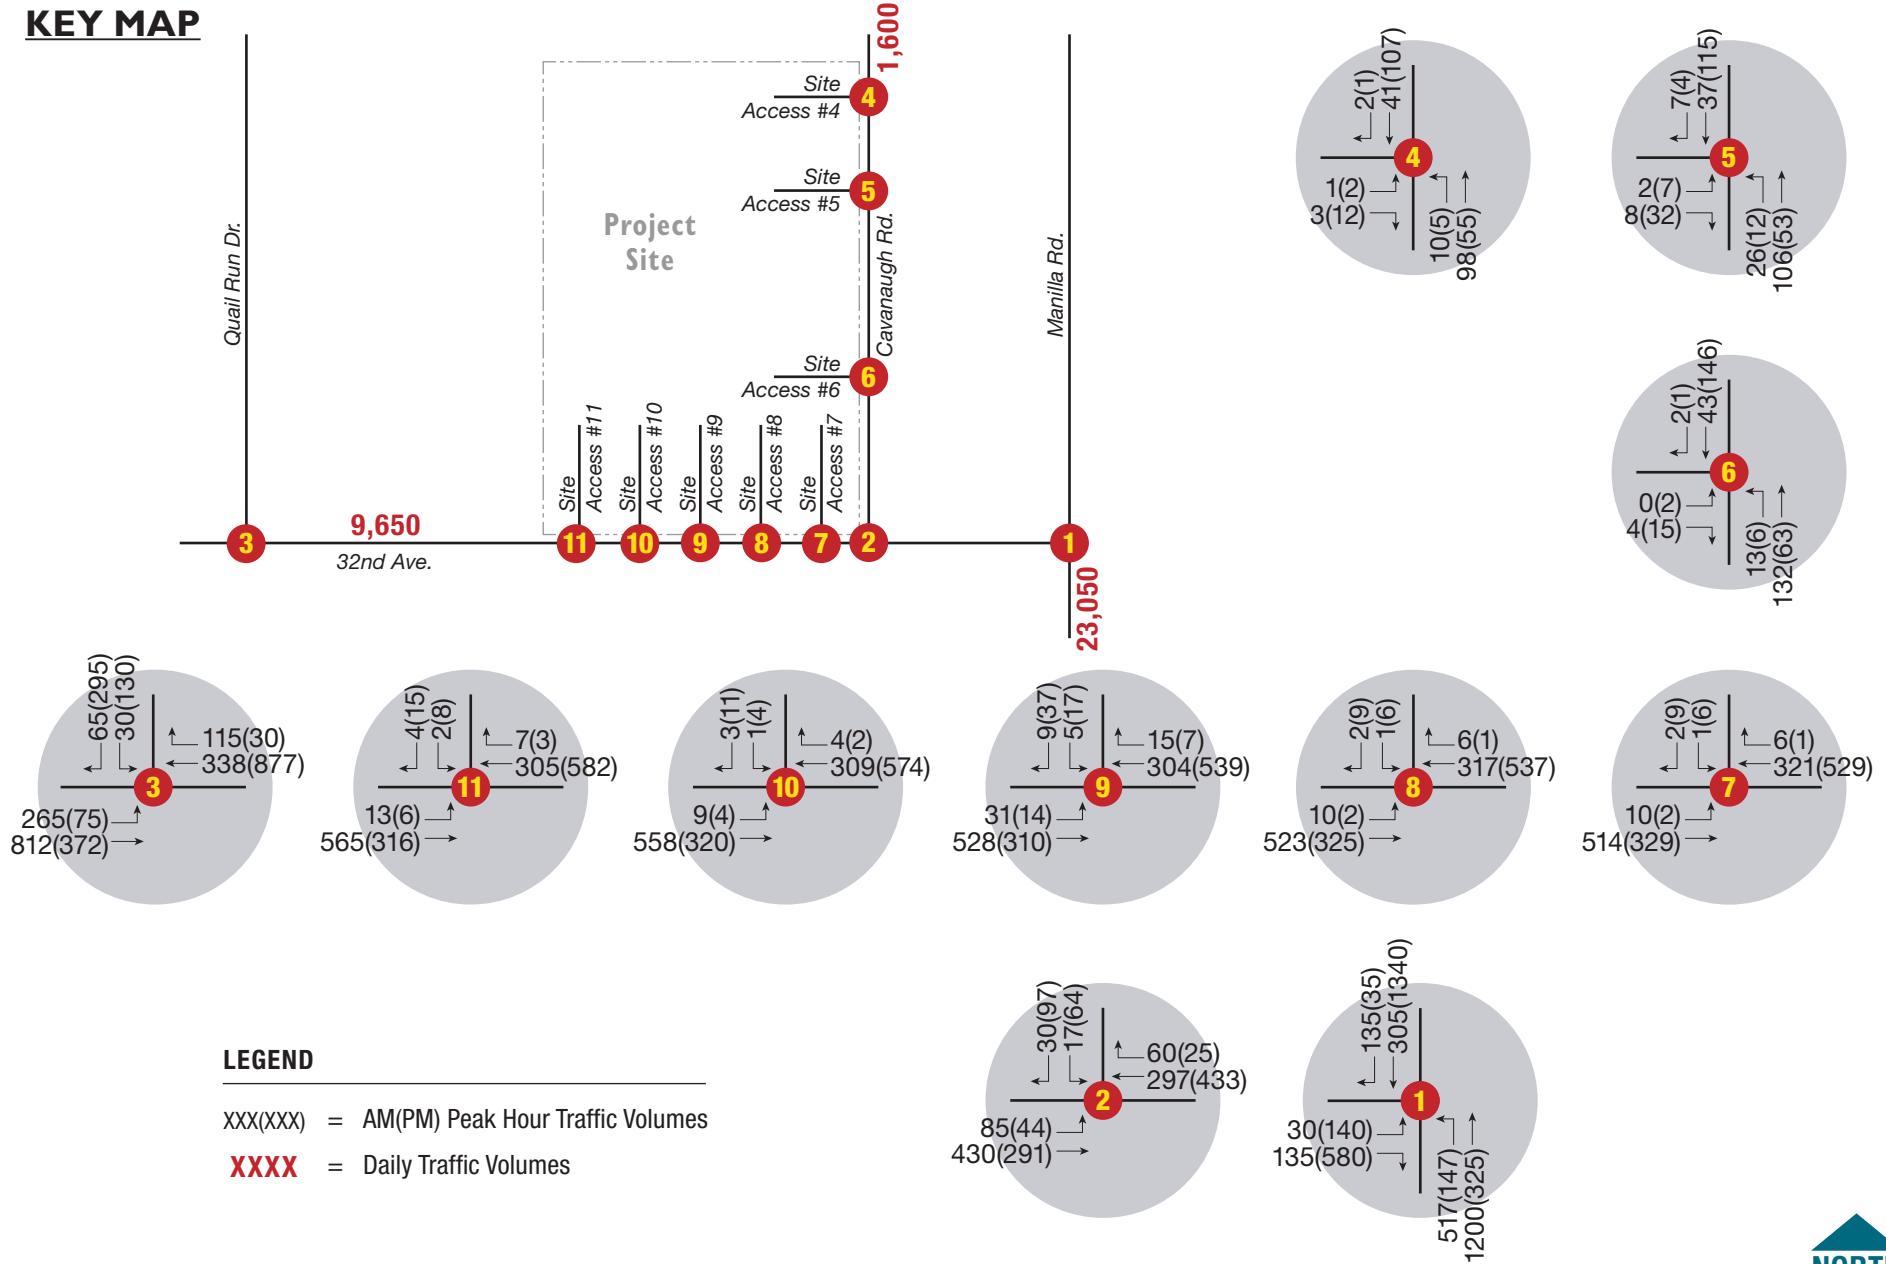

- **Left-Turn Lane Storage Lengths** – At signalized intersections, the greater of the HCM 6th Edition or Synchro methodology queue calculations were reported. For unsignalized intersections, the HCM 6th Edition calculation was reported.
- **Through Movements** – For signalized intersections, Synchro calculation results were reported. No through movement queues are reported for unsignalized intersections as through movements are free.
- **Right-Turn Movements** – For signalized intersections, the Synchro queue length was used. HCM 6th Edition information was not used because HCM's signalized intersection methodology does not account for right turns on red. For unsignalized intersections, HCM 6th Edition calculation was reported.

Tapers of 162 and 120 feet, to provide the required 13.5:1 and 10:1 taper ratios for streets with posted speeds of 45 and 35 mph, respectively, should be added to the recommended storage lengths. These taper lengths correspond to the anticipated speed limits of 45 mph along Manilla Road and 35 mph along 32nd Avenue, Cavanaugh Road, and Quail Run Drive.

Internal Intersection Traffic Control

Most of the internal intersections are in a tee-configuration, and the recommended orientation for all of these entails placing a stop sign along the “stem” of the tee. One centrally located intersection of the east-west and north-south central site driveways includes a driveway to the eastern truck court for Building 1. It is recommended that side-street stop-control be used at this intersection in the east-west direction.

*Dual turn lanes; queues and storage are per lane.

¹ Calculations based on HCM and Synchro methodologies using a heavy vehicle percentage of 20 percent network wide.

² Number shown is based on volume adjustments of 3 PCE per heavy vehicle.

V. SUMMARY AND RECOMMENDATIONS

Velocity Development Company is proposing to develop an approximate 155-acre site within the Port Colorado site. The PA 13 site is located north of the future 32nd Avenue extension and west of Cavanaugh Road. The proposed development would consist of approximately 2.2 million square feet of warehousing, as well as two 16,000 square foot amenity buildings.

The proposed development is estimated to generate approximately 3,450 trips per day, with an estimated 216 occurring during the AM peak hour and 261 occurring during the PM peak hour. By comparison to the Port Colorado Master Plan Traffic Impact Study, PA 13 was assumed to generate approximately 3,900 trips per day. The current development proposal represents a 12 percent decrease in daily traffic generation as compared to that analyzed in the 2020 Master Plan Study.

The potential traffic impacts of the development were evaluated under short-term (2026) and long-term future (NEATS buildout) conditions. Given short-term conditions, all of the study area intersections are anticipated to function acceptably. These operations are based on the inclusion of left and right turn lanes at all site accesses on 32nd Avenue and left turn lanes at all site accesses on Cavanaugh Road.

For the long-term timeframe, acceptable operations are anticipated given the following enhancements (in addition to the short-term planning horizon):

- Installing traffic signals at intersections along 32nd Avenue at Manilla Road and Quail Run Drive
- Constructing dual right turn lanes on the eastbound approach at the intersection of 32nd Avenue with Manilla Road to support other additional development within Port Colorado

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 45 (38%), Referenced to phase 4:EBTL and 8:WBT, Start of Green

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.92

Intersection Signal Delay: 27.9

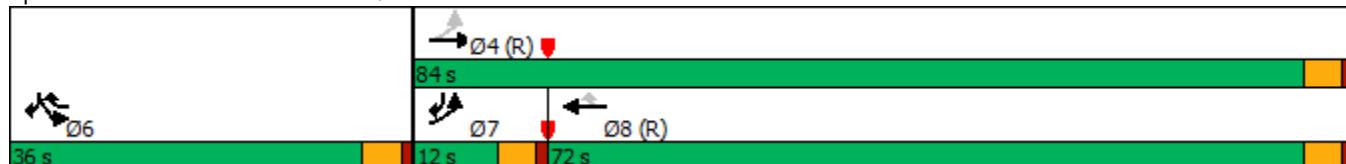

Intersection LOS: C

Intersection Capacity Utilization 65.8%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 3: 32nd Ave & Quail Run Dr

HCM 6th Signalized Intersection Summary
3: 32nd Ave & Quail Run Dr

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 120

Offset: 45 (38%), Referenced to phase 4:EBTL and 8:WBT, Start of Green

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.72

Intersection Signal Delay: 10.5

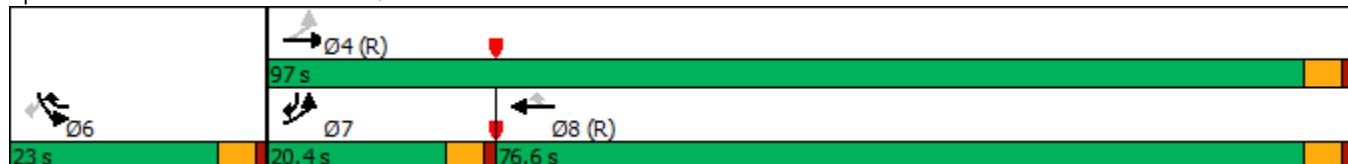

Intersection LOS: B

Intersection Capacity Utilization 54.4%

ICU Level of Service A

Analysis Period (min) 15

Splits and Phases: 3: 32nd Ave & Quail Run Dr
