Mr. James Spehalski
Marathon Land Company
9750 W. Cambridge Place
Littleton, CO 80127

Re: Harmony Phase 4
Aurora, CO
LSC #200710

Dear Mr. Spehalski:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed Harmony Phase 4 development. As shown on Figure 1, the site is located south of E. Alameda Avenue and east of Powhaton Road in eastern Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected 2024 and 2040 background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

RECENT TRAFFIC STUDIES

LSC prepared a traffic impact study (TIS) for the entire Harmony Master Plan dated March 9, 2017. LSC also prepared site-specific traffic reports for the ASP Harmony Ridge P-8 School, dated October 12, 2018, and Harmony Phase 3, dated November 4, 2020.

LAND USE AND ACCESS

Table 1 shows a comparison of the land uses assumed in the 2017 Master TIS and the existing, approved, currently proposed, and currently anticipated future land uses. Since completion of the Master TIS, Harmony Phases 1 and 2, which were included in the Master TIS as Planning Areas 1 and 2, have been approved and a majority of the homes within Phase 1 have been constructed. APS Harmony Ridge P-8 school, which was included in the Master TIS as Planning Area 17, and the Harmony Community Center, which was included in the Master TIS as

Planning Area 19, have also been constructed. Harmony Phase 3, which was included in the Master TIA as a portion of Planning Areas 3 and 4, has recently been approved.

The area currently proposed as Harmony Phase 4 was included in the Master TIS as Planning Areas 5, 6, 7, 11, 12, and 18. The Master TIS assumed these planning areas would be developed with 580 single-family homes, 115 townhomes, and a K-8 school. The site is currently proposed to include about 743 residential dwelling units including 200 carriage homes and 543 single-family detached homes. The school site formerly shown on the northwest corner of the intersection of Trussville Road/E. Exposition Avenue has been moved to the southeast corner of this intersection and is not included as part of the currently proposed Harmony Phase 4. Figure 2a shows the conceptual site plan. Figure 2b shows the proposed roadway classifications.

Access is proposed from several locations to E. Alameda Avenue, E. Exposition Avenue, S. Powhaton Road, Trussville Road, and Monaghan Road. The access plan is generally consistent with the access assumed in the Master TIS except for the access to Powhaton Road. The Master TIS assumed a right-in/right-out-only access to Powhaton Road between Planning Areas 5 and 6 and no connection to the full movement access assumed for the 20-acre future commercial parcel located on the southeast corner of Powhaton Road and E. Alameda Avenue that is not a part of the Harmony development. The current plan no longer includes the right-in/right-out access and assumes the full movement intersection to Powhaton Road (#6) south of the future commercial parcel which will be shared with the Harmony development.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **S. Powhaton Road** is a north-south roadway west of the site. The posted speed limit is 45 mph in the vicinity of the site. S. Powhaton Road is planned to be widened to a six-lane major arterial roadway by 2040. In the vicinity of the site it is currently a two-lane roadway except for a section from just south of Alameda Avenue to just north of E. 1st Avenue where the east half of the final cross-section has been constructed. This half section is planned to be extended to just south of E. Exposition Avenue as part of Harmony Phase 4.
- **Monaghan Road** is planned as a future north-south, six lane arterial roadway east of the site per the *Aurora Northeast Area Transportation Study* (NEATS). The west half of Monaghan Road is planned to be constructed between E. Exposition Avenue and E. Alameda Avenue as part of the currently proposed Harmony Phase 4. The existing Airpark/Monaghan Road I-70 interchange is currently going through a Federal 1601 process with CDOT and FHWA to plan for the future reconstruction of the interchange to serve long-term needs.
- **E. Alameda Avenue** is an east-west, four-lane minor arterial roadway north of the site. The north half of E. Alameda Avenue has been constructed between Powhaton Road and Trussville Road. As part of the currently proposed Harmony Phase 4, E. Alameda Avenue will be constructed to its final cross-section between Powhaton Road and Waterloo

Street South and the south half of the cross-section will be constructed between Waterloo Street South and Monaghan Road.

- **E. Exposition Avenue** is an east-west, two-lane collector roadway south of the site. The north half of the final E. Exposition Avenue cross-section will be constructed between Powhaton Road and Monaghan Road with two travel lanes as part of the currently proposed Harmony Phase 4.
- **Trussville Road** is north-south, two-lane collector roadway that currently extends from E. Alameda Avenue to E. 1st Avenue. Trussville Road will be extended south to E. Exposition Avenue as part of Harmony Phase 4. The intersections with E. Alameda Avenue and E. Exposition Avenue are planned as modern roundabouts.

Figure 2b shows the proposed roadway classifications.

Existing Traffic Conditions

Figure 3 shows the existing traffic volumes, lane geometries, and traffic controls in the site's vicinity on a typical weekday. The daily traffic volumes are based on the attached traffic counts conducted by Counter Measures in November, 2020.

Pandemic Adjustment

These traffic counts may have been impacted by the ongoing pandemic, however, based on the attached counts conducted at the intersection of Powhaton Road and E. 6th Avenue in May 2020 and again in November 2020 it appears that traffic patterns in the vicinity of the site have returned closer to the pre-pandemic condition. The City of Aurora Traffic Engineering approved a COVID-19 adjustment factor of 1.4 to be applied to the traffic counts conducted in May 2020 as part of the JAMASO traffic impact study completed by LSC Transportation Consultants, Inc. This adjustment factor was based on the attached data collected by the City at several arterial intersections in March 2019 and April 2020. As shown on Appendix Table 1 the calculated growth factor for the section of N. Powhaton Road south of E. 6th Avenue between May 2020 and November 2021 was 1.5. This is consistent with a six-months growth factor of 1.01 (based on the typical 2 percent annual growth rate used by the City of Aurora) plus a COVID-19 adjustment factor of 1.4.

2024 and 2040 Background Traffic

Figure 4 shows the estimated 2024 background traffic based a two percent annual growth rate for through traffic on N. Powhaton Road plus estimates of additional traffic projected to be generated by buildup of Harmony Phases 1 through 3 located north of the currently proposed Phase 4 and Phase 1 of the Sky Ranch development located south of I-70 between Powhaton Road and Hayesmount Road. Appendix Figures 1 through 6 show the traffic projected to be generated by these developments. The relevant pages from the referenced traffic impact studies are also attached. The 2024 background traffic volumes assume E. Alameda Avenue and E. Exposition Avenue have not been constructed east to Monaghan Road and Monaghan Road has not been constructed north of E. Alameda Avenue or south of E. Exposition Avenue.

Figure 5 shows the estimated 2040 background traffic based on recent NEATS modeling updates and the Master Traffic Studies for Harmony and Sky Ranch. Figures 4 and 5 also show the estimated 2024 and 2040 lane geometries and traffic controls in the vicinity of the site.

2024 and 2040 Background Levels of Service

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A is indicative of little congestion or delay and LOS F is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in Figures 4 and 5 were analyzed to determine the 2024 and 2040 background levels of service using Synchro. Table 2 shows the level of service analysis results. The level of service reports are attached.

- 1. Powhaton Road/E. Alameda Avenue:** This intersection is projected to operate at LOS "C" or better for all movements through 2024 as a two-stage, stop-sign controlled "T" intersection. By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and that the intersection with E. Alameda Avenue would be converted to traffic signal control. Powhaton Road/E. Alameda Avenue is projected to operate at an overall LOS "C" as a signalized intersection during both morning and afternoon peak hours through 2040.
- 2. E. Alameda Avenue/Trussville Road:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
- 3. E. Alameda Avenue/Waterloo Street:** All movements at this stop-sign controlled, right-in/right-out intersection are expected to operate at LOS "B" or better during both morning and afternoon peak-hours through 2040.
- 4. Monaghan Road/E. Alameda Avenue:** This future signalized intersection is expected to operate at an overall LOS "B" during both morning and afternoon peak-hours through 2040.
- 5. Intentionally Left Blank**
- 6. Powhaton Road/PA-6 Access:** By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and a west leg would be constructed to serve future development west of Powhaton Road. Based on the projected 2040 total traffic volumes the eastbound and westbound left-turn and through movements are projected to operate at LOS "E" or "F" during the morning peak-hour and LOS "F" during the afternoon peak-hour if this intersection remains stop-sign controlled.
- 7. Intentionally Left Blank**
- 8. Monaghan Road/PA-13 Access:** All movements at this future stop-sign controlled intersection are expected to operate at LOS "B" or better through 2040.

9. **E. Exposition Avenue/Powhaton Road:** By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and that the intersection with E. Exposition Avenue would be converted to traffic signal control. Powhaton Road/E. Exposition Avenue is projected to operate at an overall LOS "B" as a signalized intersection during both morning and afternoon peak hours through 2040.
10. **E. Exposition Avenue/Future PA-8 Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
11. **E. Exposition Avenue/Future PA-10 Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
12. **E. Exposition Avenue/Trussville Road:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
13. **E. Exposition Avenue/Future Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
14. **E. Exposition Avenue/Monaghan Road:** This future signalized intersection is expected to operate at an overall LOS "C" during both morning and afternoon peak-hours through 2040.

TRIP GENERATION

Table 1 shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the proposed land use based on the rates from *Trip Generation, 10th Edition, 2017* by the Institute of Transportation Engineers (ITE). Table 1 also shows a comparison of the current trip generation for the entire Harmony Master Plan area to the trip generation estimate assumed in the Master TIS.

Harmony Phase 4 is expected to generate about 7,014 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. This is about 120 fewer vehicle-trips per day than was assumed for the same area in the Master TIS. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 137 vehicles would enter and about 412 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 463 vehicles would enter and about 272 vehicles would exit.

DIRECTIONAL DISTRIBUTION

Figure 6 shows the estimated directional distribution of the site-generated traffic volumes on the area roadways. The estimates were based on the location of the site with respect to the re-

gional population, employment, and activity centers; the site's proposed land use; and the assumptions of the Master TIS.

TRIP ASSIGNMENT

Figure 7 shows the estimated assignment of 2024 site-generated traffic volumes based on the trip generation estimate (from Table 1) and the 2024 directional distribution shown in Figure 6. It assumes no connection northeast or southeast.

Figure 8 shows the estimated assignment of 2040 site-generated traffic volumes based on the trip generation estimate (from Table 1) and the 2040 directional distribution shown in Figure 6.

2024 AND 2040 TOTAL TRAFFIC

Figure 9 shows the estimated 2024 total traffic which is the sum of the 2024 background traffic volumes (from Figure 4) and the 2024 site-generated traffic volumes (from Figure 7). Figure 9 also shows the recommended 2024 lane geometry and traffic control.

Figure 10 shows the estimated 2040 total traffic which is the sum of the 2040 background traffic volumes (from Figure 5) and the 2040 site-generated traffic volumes (from Figure 8). Figure 10 also shows the recommended 2040 lane geometry and traffic control.

PROJECTED LEVELS OF SERVICE

The intersections in Figures 9 and 10 were analyzed to determine the 2024 and 2040 total levels of service. Table 2 shows the level of service analysis results. The level of service reports are attached.

- 1. Powhaton Road/E. Alameda Avenue:** This intersection is projected to operate at LOS "C" or better for all movements through 2024 as a two-stage, stop-sign controlled "T" intersection. By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and that the intersection with E. Alameda Avenue would be converted to traffic signal control. E. Alameda Avenue/Powhaton Road is projected to operate at an overall LOS "C" as a signalized intersection during both morning and afternoon peak-hours through 2040.
- 2. E. Alameda Avenue/Trussville Road:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
- 3. E. Alameda Avenue/Waterloo Street:** All movements at this stop-sign controlled, right-in/right-out intersection are expected to operate at LOS "B" or better during both morning and afternoon peak-hours through 2040.
- 4. Monaghan Road/E. Alameda Avenue:** This future signalized intersection is expected to operate at an overall LOS "C" during both morning and afternoon peak-hours through 2040.

5. **Trussville Road/PA-11 North Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "A" during both morning and afternoon peak-hours through 2040.
6. **Powhaton Road/PA-6 Access:** This intersection is projected to operate at LOS "B" or better for all movements through 2024 as a two-stage, stop-sign controlled "T" intersection. By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and a west leg would be constructed to serve future development west of Powhaton Road. Based on the projected 2040 total traffic volumes the eastbound and westbound left-turn and through movements are projected to operate at LOS "F" during both morning and afternoon peak-hours if this intersection remains stop-sign controlled. If converted to traffic signal control or a modern roundabout this intersection is projected to operate at an overall LOS "B" or better through 2040. If vehicles from the currently proposed Harmony Phase 4 wish to avoid excessive delay during the peak-hours they would have the option to travel south to the planned intersection with E. Exposition Avenue or north through the future parcel located southeast of the intersection of N. Powhaton Road/E. Alameda Avenue that is not a part of the Harmony development to an intersection with E. Alameda Avenue. LSC recommends the traffic control at this intersection be reevaluated when plans are submitted for the development of the 20-acre commercial parcel located on the northeast corner that is not part of the Harmony development and/or when plans are submitted for the development of the property on the west side of Powhaton Road.
7. **Trussville Road/PA-11 South Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "B" or better during both morning and afternoon peak-hours through 2040.
8. **Monaghan Road/PA-13 Access/PA-12 Access:** All movements at this future stop-sign controlled intersection are expected to operate at LOS "C" or better through 2040.
9. **Powhaton Road/E. Exposition Avenue:** This intersection is projected to operate at LOS "C" or better for all movements through 2024 as a two-stage, stop-sign controlled "T" intersection. By 2040 it was assumed that Powhaton Road would be constructed to its final six-lane cross-section and that the intersection with E. Exposition Avenue would be converted to traffic signal control. Powhaton Road/E. Exposition Avenue is projected to operate at an overall LOS "B" as a signalized intersection during both morning and afternoon peak-hours through 2040.
10. **E. Exposition Avenue/PA-5 Access/Future PA-8 Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
11. **E. Exposition Avenue/PA-7 Access/Future PA-10 Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.

- 12. E. Exposition Avenue/Trussville Road:** This roundabout controlled intersection is expected to operate at an overall LOS "A" during both morning and afternoon peak-hours through 2040.
- 13. E. Exposition Avenue/PA-12 Access/Future Access:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040.
- 14. E. Exposition Avenue/Monaghan Road:** This future signalized intersection is expected to operate at an overall LOS "C" during both morning and afternoon peak-hours through 2040.

95TH PERCENTILE QUEUE LENGTHS AND RECOMMENDED TURN LANES

The estimated 95th percentile queue lengths for the intersections in the study area are shown in Table 3 along with the recommended turn lane lengths.

TRAFFIC SIGNAL WARRANT ANALYSIS

Tables 4a through 4e show the projected traffic volumes compared to the traffic volume thresholds for Traffic Signal Warrant 1 (Eight-Hour), Warrant 2 (Four-Hour), and Warrant 3 (Peak-Hour) at the intersections of Powhaton Road/E. Alameda Avenue (#1), Monaghan Road/E. Alameda Avenue (#4), Powhaton Road/PA-6 Access (#6), Powhaton Road/E. Exposition Avenue (#9), and Monaghan Avenue/E. Exposition Avenue (#14). The findings of Tables 4a through 4e are summarized in Table 5. All of these intersections are expected to meet traffic signal warrants between 2024 and 2040.

PEDESTRIAN ACCOMMODATION

An east-west crosswalk with a pedestrian-activated Rectangular Rapid Flashing Beacon (RRFB) is proposed at Intersection #7 to assist pedestrians with crossing Trussville Road.

DEFERRAL OF SOUTH HALF OF E. ALAMEDA AVENUE CONSTRUCTION

The applicant is proposing to defer the ultimate widening of E. Alameda Avenue to occur once a four-lane section is required due to traffic volumes. The applicant would be willing to escrow funds with the City so construction could occur rather quickly once deemed to be necessary.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

1. Harmony Phase 4 is expected to generate about 7,014 vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour about 137 vehicles would enter and about 412 vehicles would exit the site. During the afternoon peak-hour about 463 vehicles would enter and about 272 vehicles would exit.

Projected Levels of Service

2. All of the signalized and roundabout controlled intersections in the study area are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.
3. All movements at the unsignalized intersections in the study area except for Intersection #6 are expected to operate at LOS "D" or better during both morning and afternoon peak-hours through 2040.
4. The intersection of Powhaton Road and the shared access for Harmony Phase 4 and the future 20-acre commercial parcel (Intersection #6) is projected to operate at LOS "C" or better for all movements through 2024 as a two-stage, stop-sign controlled "T" intersection. LSC recommends the traffic control at this intersection be reevaluated when the adjacent commercial parcel that is not part of the Harmony development or the parcels east of Powhaton Road develop.

Conclusions

5. The impact of the site can be accommodated by the existing and planned roadway network with the following recommended improvements.

Recommendations

6. The recommended improvements for 2024 are shown in Figure 9.
7. The recommended improvements for 2040 are shown in Figure 10.
8. The recommended turn lane lengths and tapers are shown in Table 3.
9. The timing of traffic signal warrants at the key area intersections is shown in Table 5.
10. The applicant should coordinate with the City on the details of entering into a deferral agreement for the ultimate buildout of E. Alameda Avenue adjacent to the site.

* * * * *

We trust our findings will assist you in gaining approval of the proposed Harmony Phase 4 development. Please contact me if you have any questions or need further assistance.

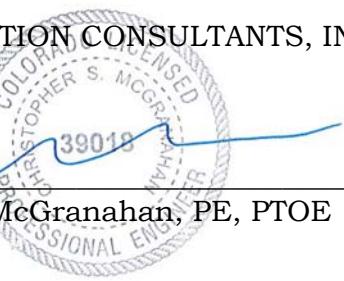

Sincerely,

LSC TRANSPORTATION CONSULTANTS, INC.

Re: Sky Ranch GDP -
Neighborhoods A and B
Traffic Impact Analysis
Arapahoe County, CO
LSC #181150
Arapahoe County Case No.
GDP18-007/PP18-001

Dear Mr. Harding:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic study for the proposed Sky Ranch GDP - Neighborhoods A and B to address County and CDOT comments to support the overall Sky Ranch GDP. The study focuses on the buildup impacts of Neighborhoods A and B plus the traffic equivalent of about 293 additional single-family detached homes with only interim improvements to the I-70/ Monaghan Road interchange. The additional traffic equivalent from 293 homes may be located in Neighborhoods D, E, or F and could be generated by residential or non-residential land uses. The study also provides an assignment of the overall Sky Ranch site-generated trips once the area roadway network is completed as well as the estimated 2040 total daily traffic on the major roadways in the study area. Arapahoe County, David Evans & Associates, and others recently began the *I-70 Airpark & Watkins Interchange Study* to explore the most appropriate interim and ultimate configuration for interchange improvements. The study team has determined the existing bridge over I-70 is in good condition, so there will likely be phased interchange improvements proposed. As shown on Figure 1, the site is located south of I-70 between Powhaton Road and Hayesmount Road in Arapahoe County, Colorado.

This Traffic Impact Analysis is intended to be read in conjunction with the Traffic Impact Analysis being conducted by David Evans & Associates regarding interim improvements for the Airpark (Monaghan)/I-70 Interchange, under which certain interchange improvements will accommodate the trip generation equivalency of 1,450 single-family homes.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing

Notes:

1. Assumes only 10 percent of Recreation Center trips and 10 percent of school trips impact the I-70 interchange because the balance are assumed to be internal to the site.
2. The trip assignment show is the daily trip generation potential equivalent of 1,400 single-family detached homes.
3. 13,215 trips/9.44 trips/day = 1,400 homes.

LEGEND:

$\frac{26}{35}$ = AM Peak Hour Traffic
 $\frac{35}{26}$ = PM Peak Hour Traffic

November 4, 2020

Mr. James Spehalski
Marathon Land Company
9750 W. Cambridge Place
Littleton, CO 80127

Re: Harmony CSP 3
Aurora, CO
LSC #190710

Dear Mr. Spehalski:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed Harmony CSP 3 development to address City comments. As shown on Figure 1, the site is located south of E. 1st Avenue and east of Trussville Road in eastern Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected 2024 and 2040 background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

LAND USE AND ACCESS

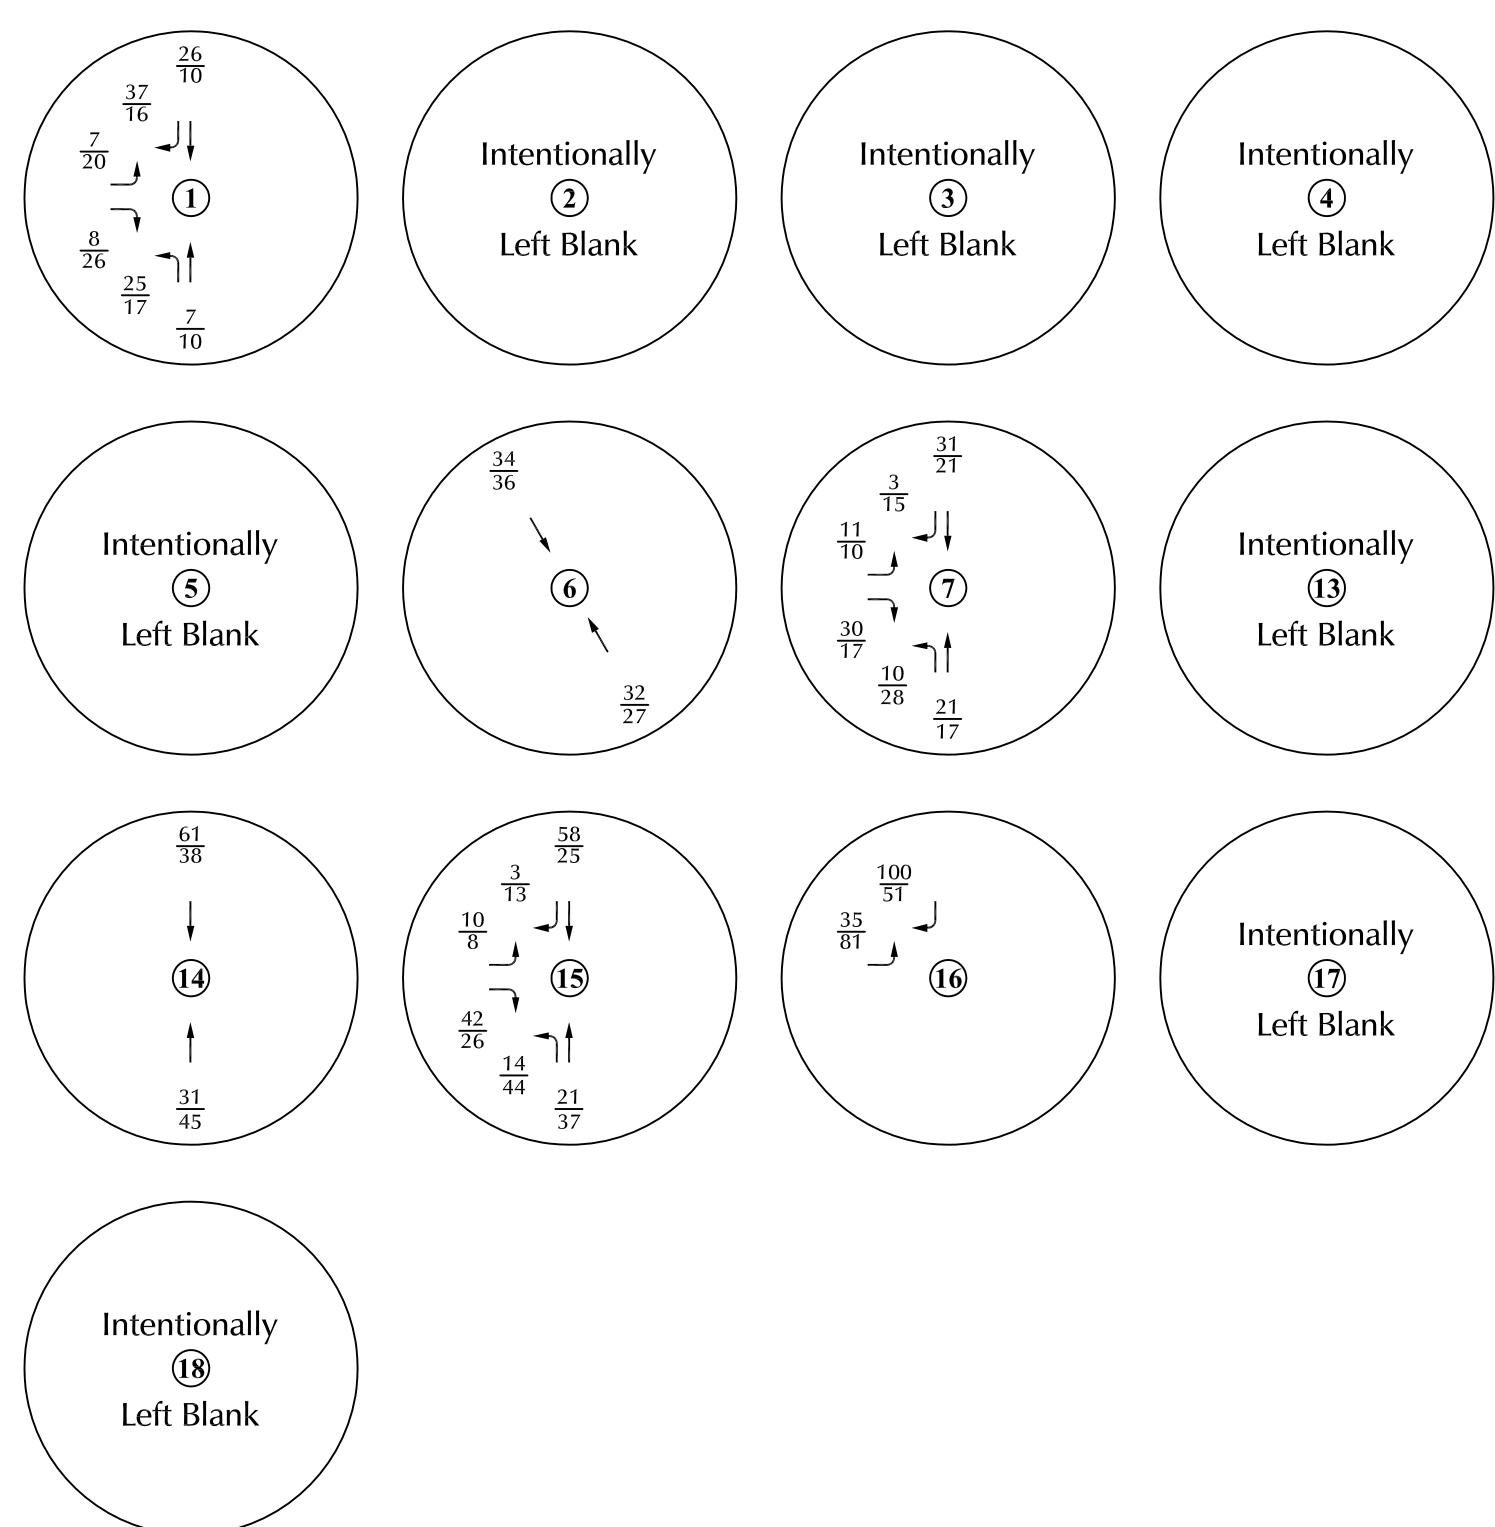

The site is proposed to include about 439 single-family dwelling units, about 72 townhomes, and a 10,000 square-foot fire station. Access is proposed from several locations to Trussville Road, E. 1st Avenue, and E. Alameda Avenue. Figure 2 shows the conceptual site plan.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

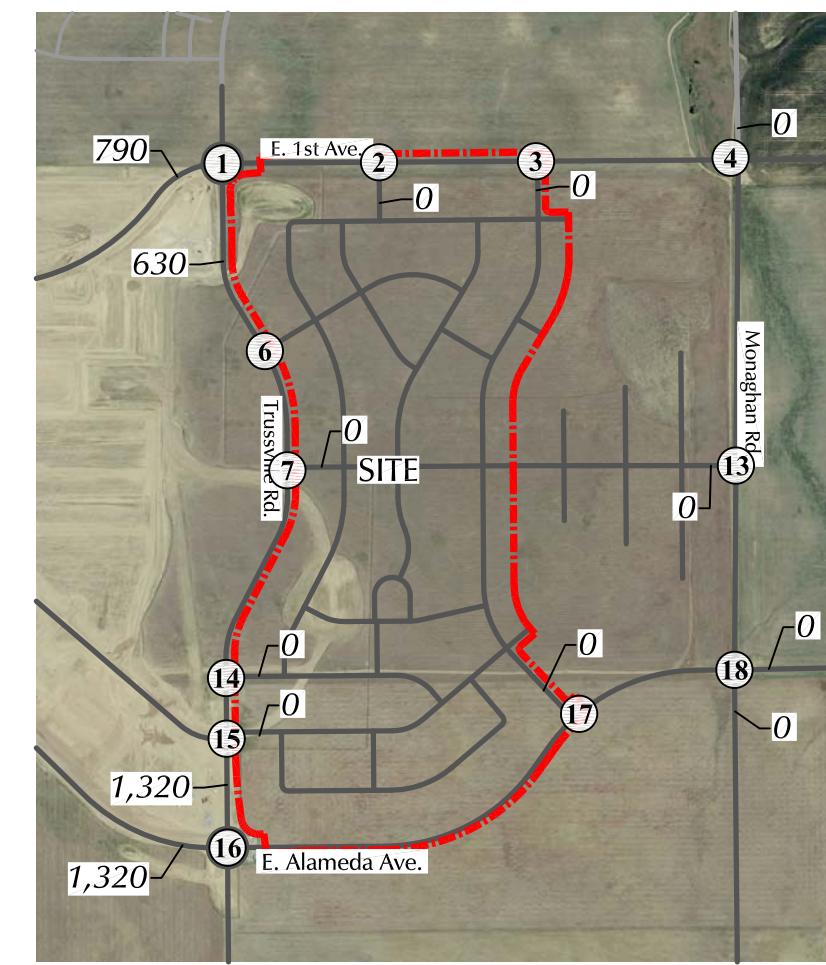

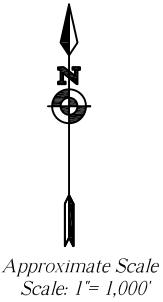

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **E. 1st Avenue** is an east-west, two-lane collector roadway planned north of the site. The intersection with Trussville Road will be a modern single-lane roundabout.

LEGEND:

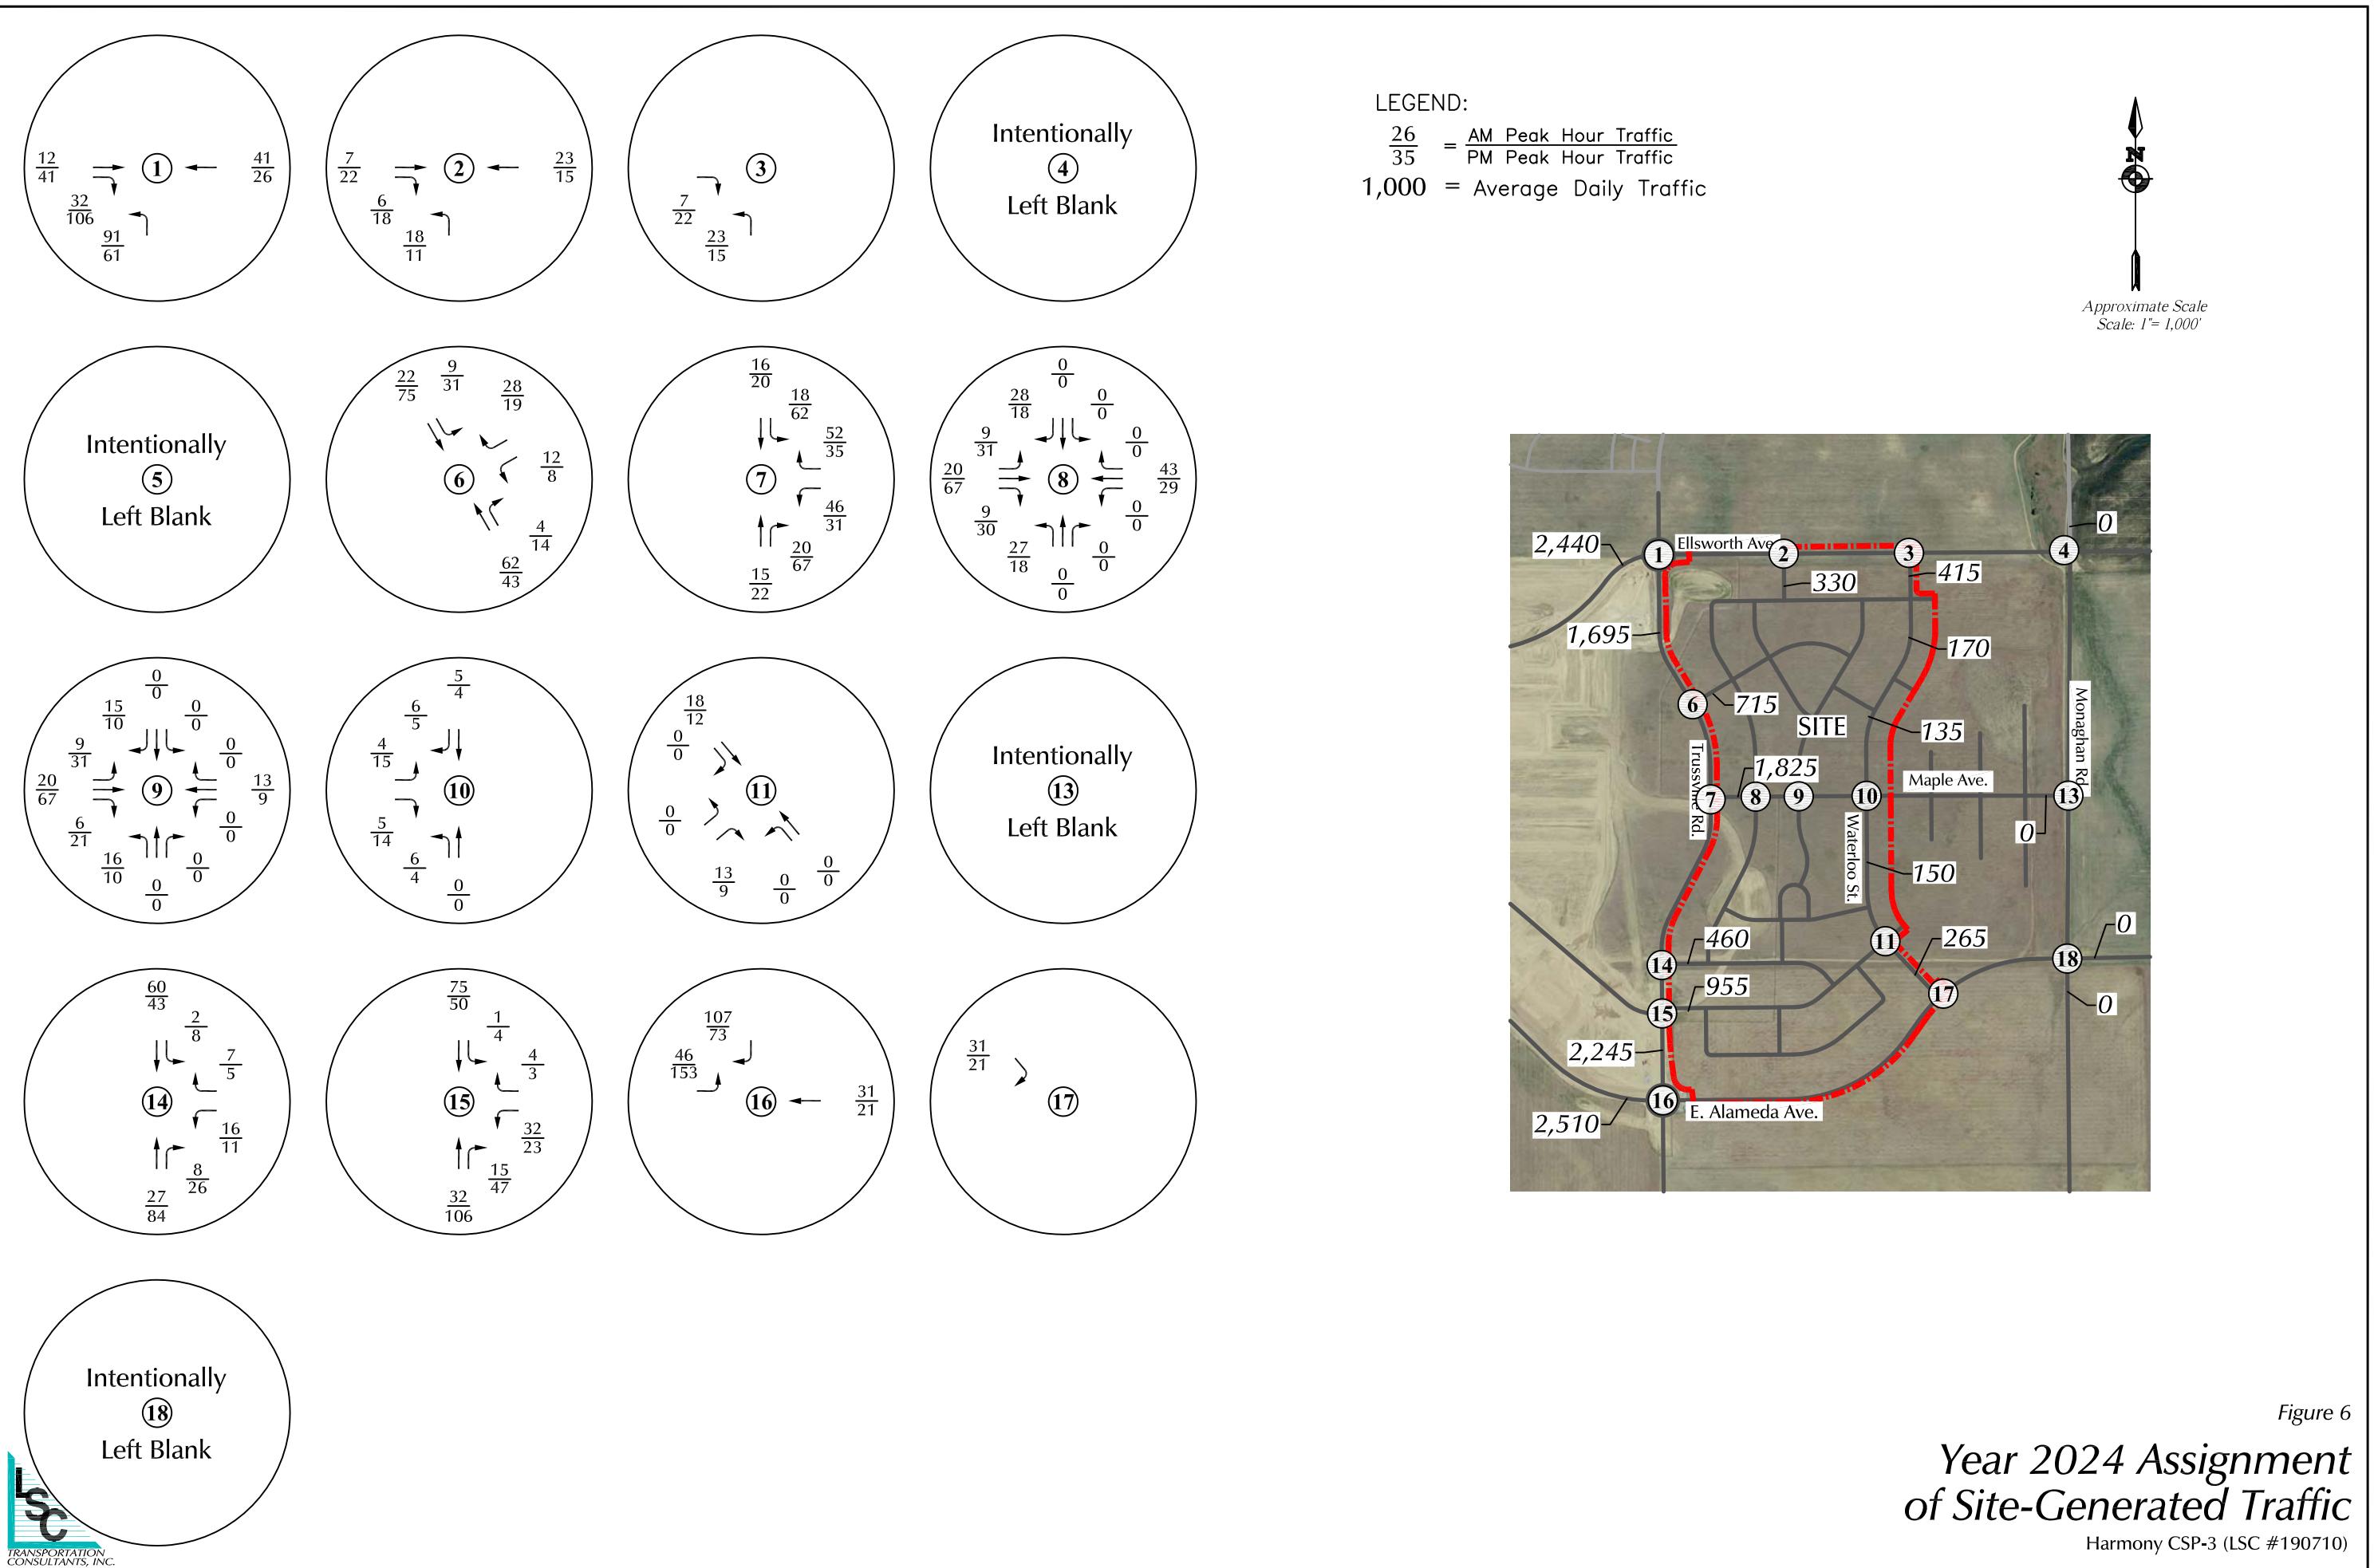

$\frac{26}{35}$	= AM Peak Hour Traffic
$\frac{35}{35}$	= PM Peak Hour Traffic
1,000	= Average Daily Traffic

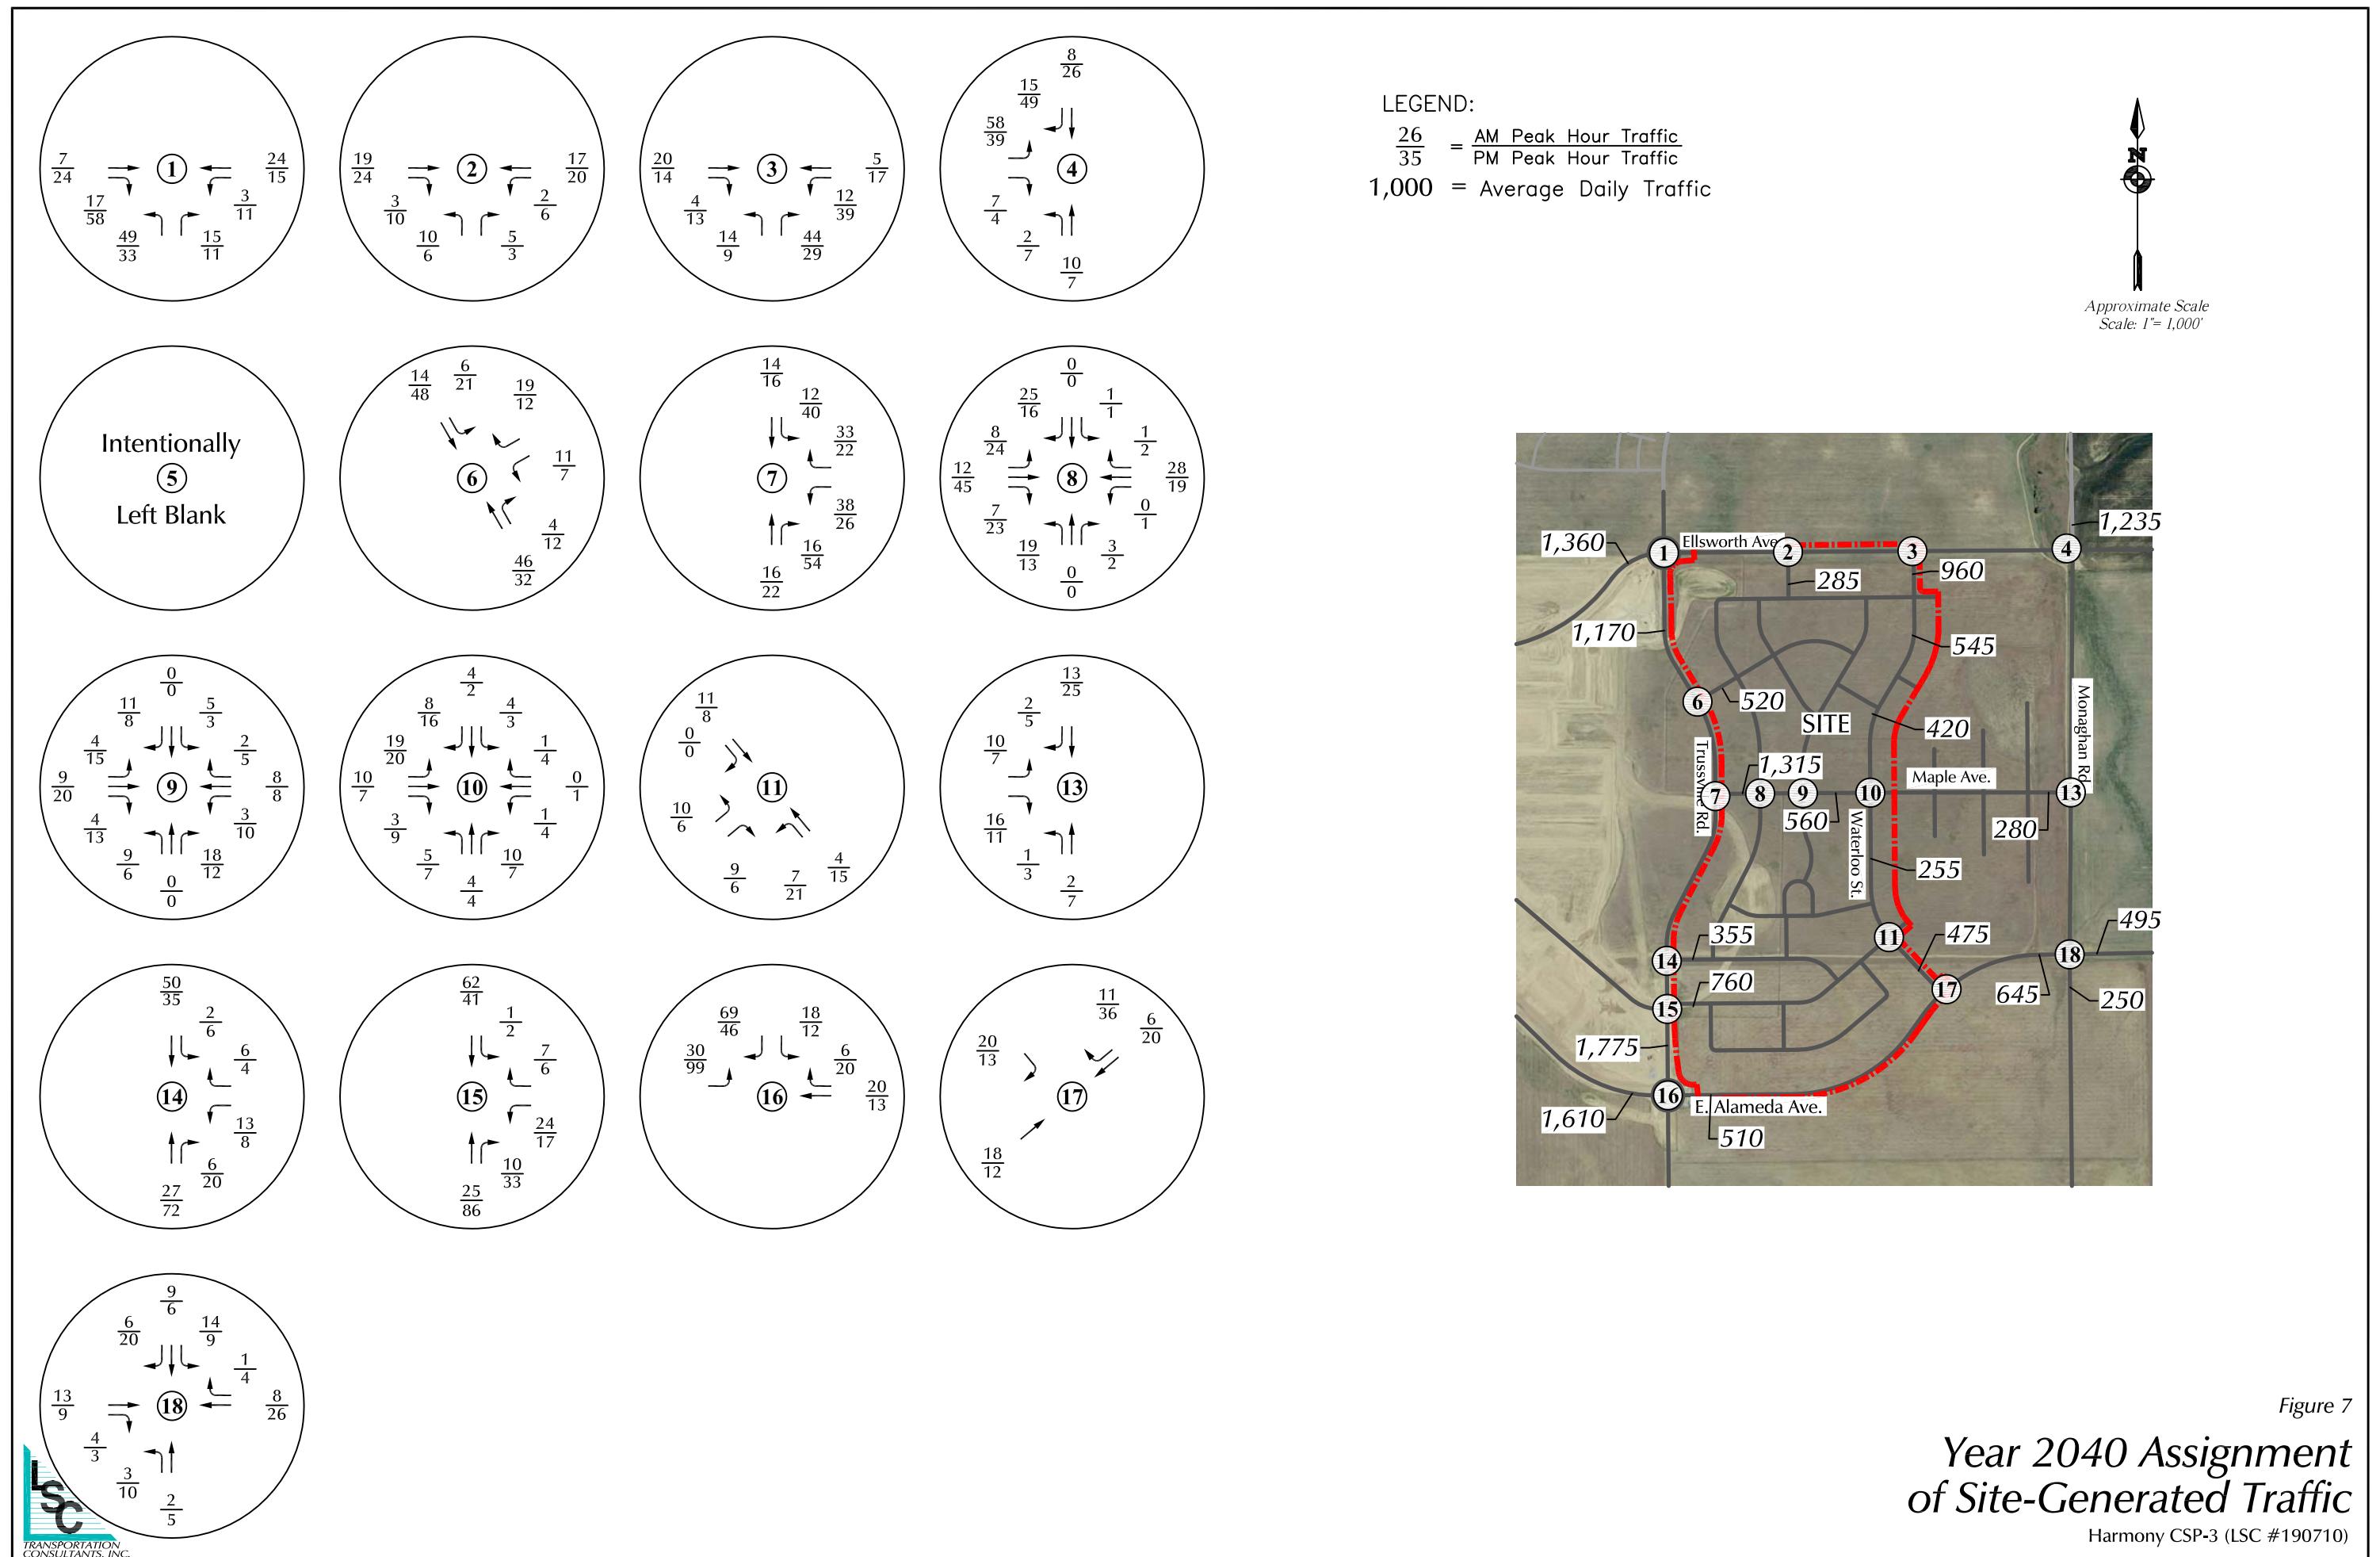

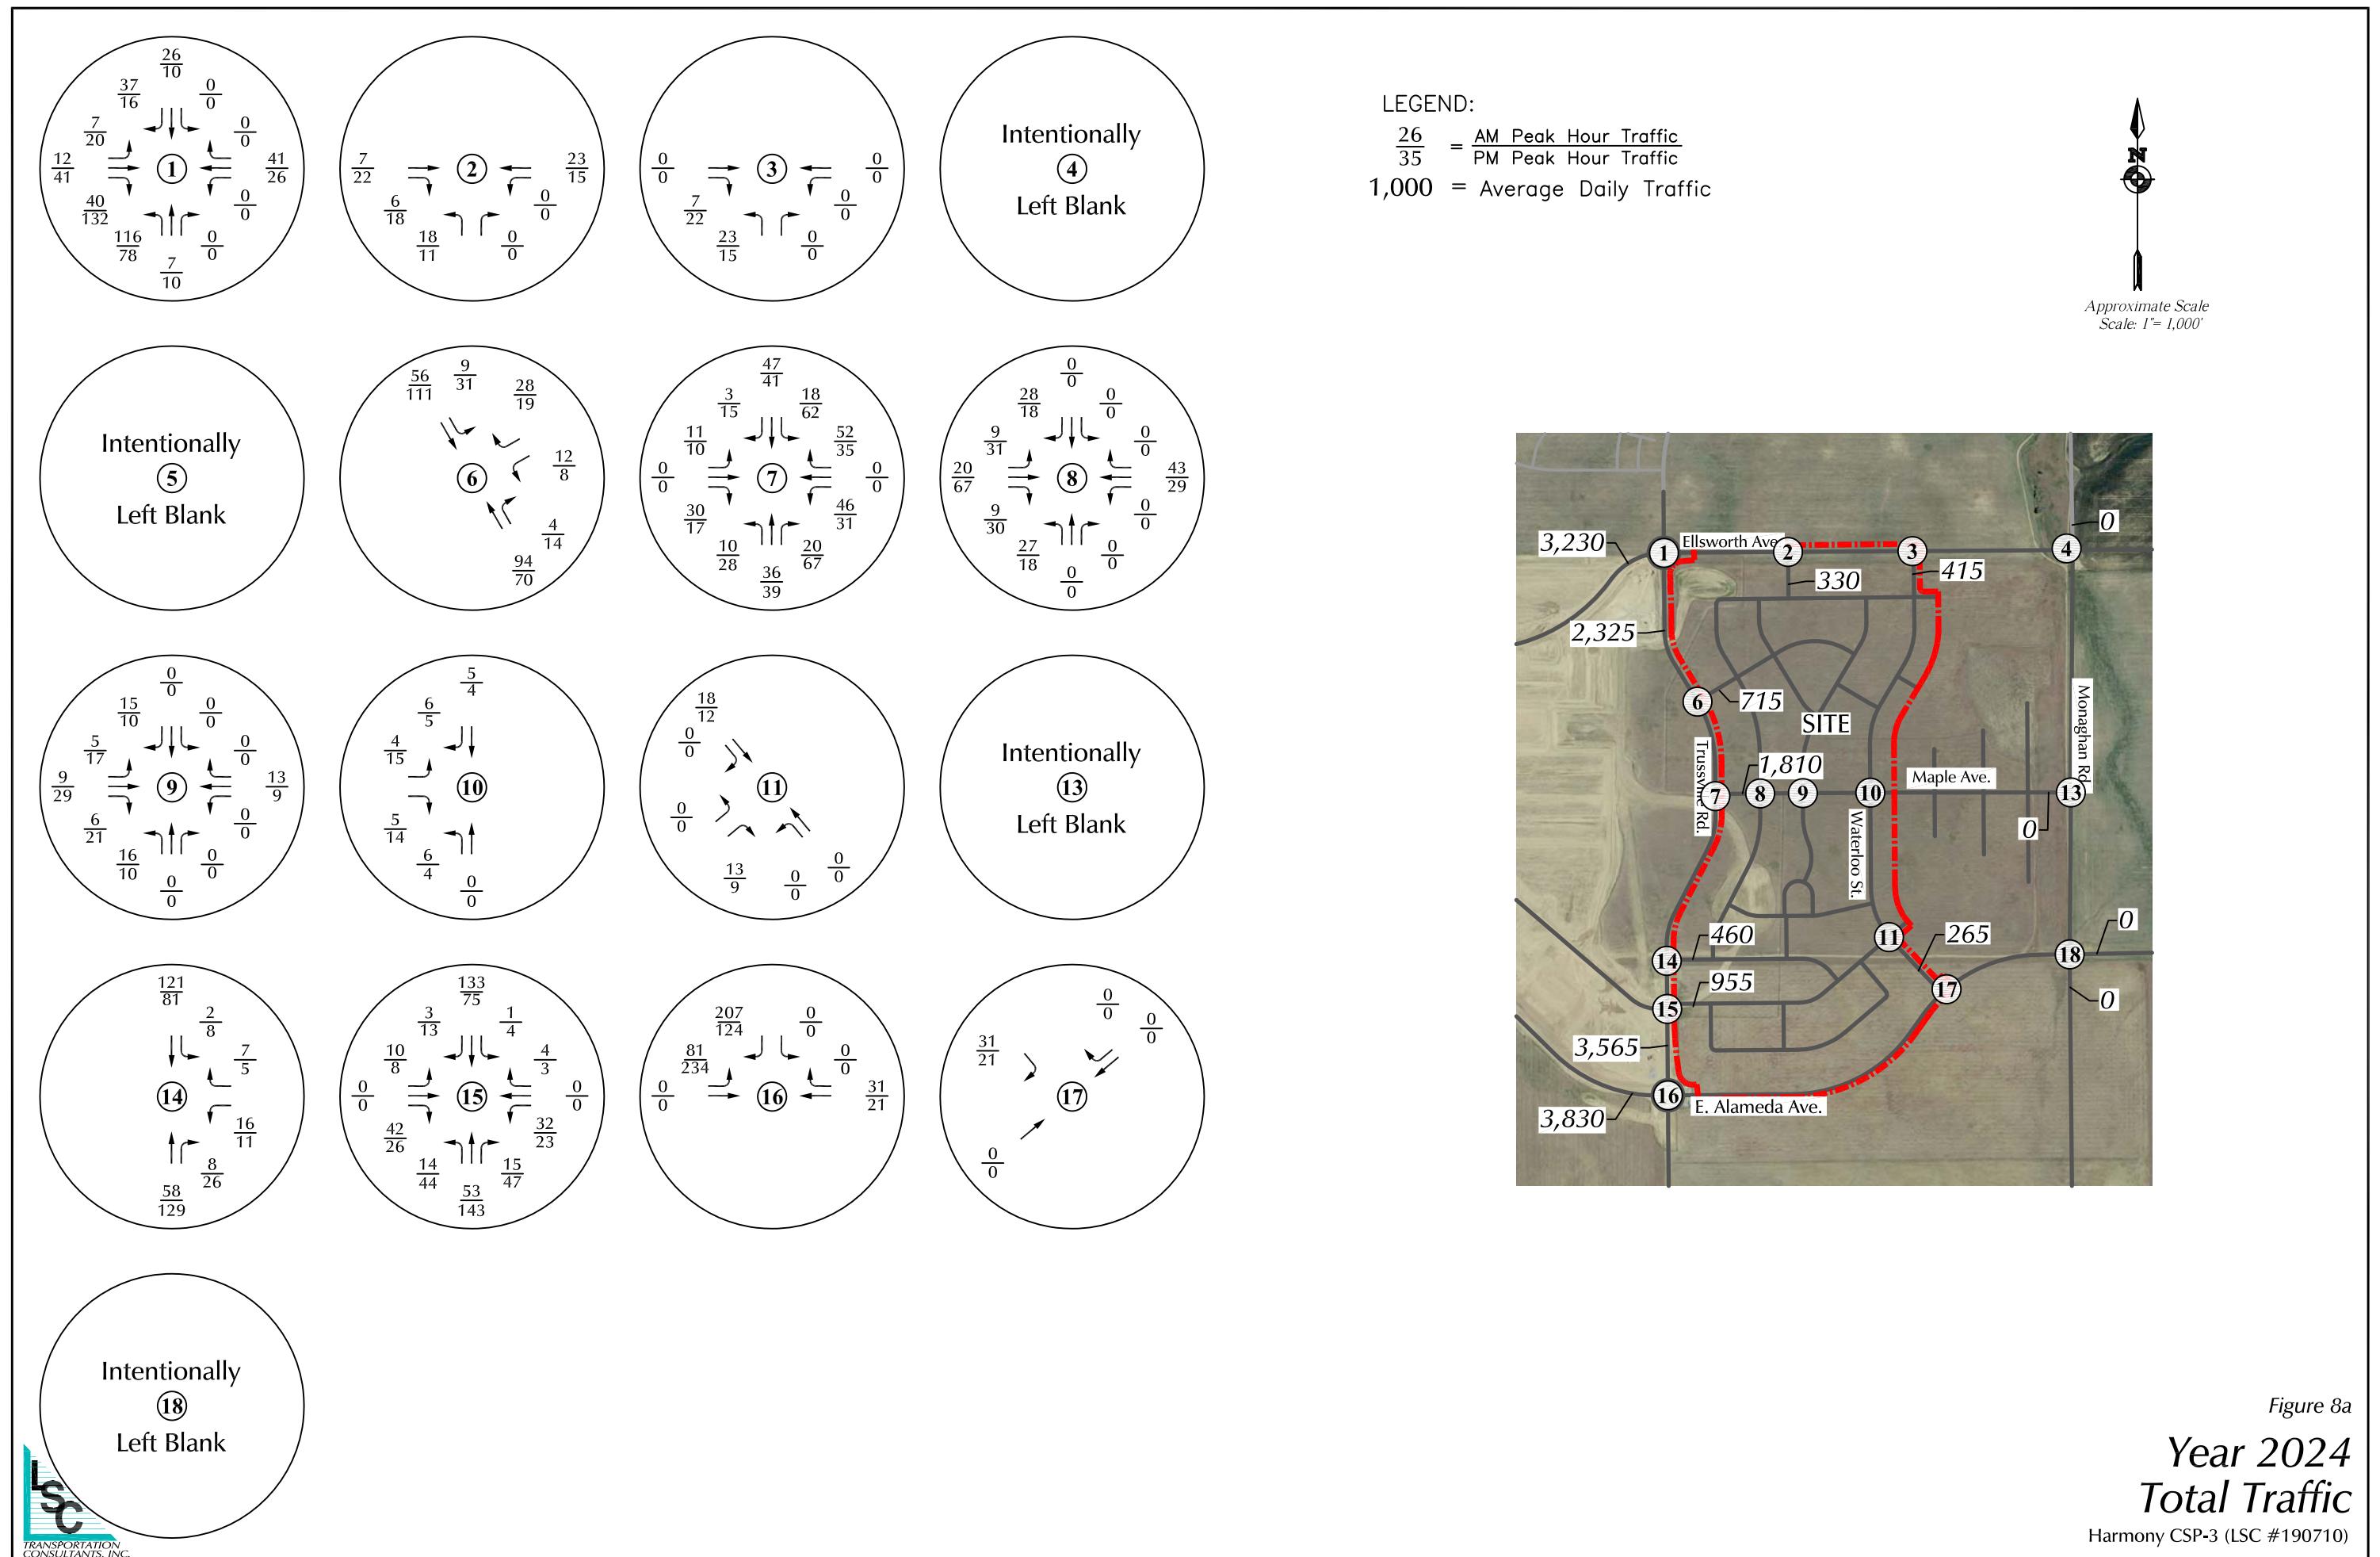

Note: Assumes no connection east to Monaghan Road by 2024 and buildout of the Harmony development phases to the west based on the Master Harmony TIS by LSC dated March 9, 2017.

Subject: RE: JAMASO - raw traffic counts for your review

Chris,

City Traffic Engineering supports the use of adjustment factor proposed. Approval has been given for this 1.40.

Internal to City Traffic Engineering there is some concern that traffic volumes have increased since volumes were taken, and as such the proposed escalation factor may be overly conservative, and if desired your development take counts on some arterials to support a reduction from 1.4 to a smaller adjustment factor. Also of concern is that the reduction in the daily volumes and the peak hour volumes were not reduced by the same amount, and some locations had a greater impact or reduction. The City Traffic management would like to offer the raw data (source information) for the previously provided, if desired to allow for the Traffic Engineering consultant to do a throughout review of raw data and their own analysis (vs the previously provided summary document).

If you have any questions, please let me know.

Thanks,

Brianna S. Medema, P.E.

Subject: RE: JAMASO - raw traffic counts for your review

Brianna,

After reviewing all of the data it feels like an appropriate adjustment factor is about 1.40. A large percentage of the roadway links seem to hover around this level.

Let me know if you concur and we will make the appropriate adjustments to our raw data.

Thank you,

Subject: RE: JAMASO - raw traffic counts for your review

Chris,

Please see the attached summary of data collected by the City in regards to COVID-19's impact on traffic volumes on arterials around the City. Please review and propose an adjustment factor for your collected data based on the most similar segment in the attachment.

Please note that the City assumes a 2% annual escalation unless other DRCOG data can support an alternate number (2018 vs 2020 volumes).

Thanks,

[Facebook](#) | [Twitter](#) | [Instagram](#) | [Nextdoor](#) | [AuroraTV.org](#)

Thank you for your message. Because of the ongoing impact of the coronavirus, the city of Aurora is focused on providing essential services to our residents and is restricting the number of employees in the office in order to help stop the spread of COVID-19. At this time, I am working remotely. I can retrieve VM from my desk phone, but ask that you first try to contact me via email. See Aurora's [COVID-19 webpage](#) for up to date information.

Subject: JAMASO - raw traffic counts for your review

Brianna,

When we last spoke regarding the JAMASO project you suggested I forward the traffic counts to you so you can make a suggestion of what adjustment, if any, we should assume to account for the safer at home order.

Please find attached the weekday morning and afternoon peak hour traffic counts for E. 6th Avenue/Powhaton Road and the daily counts for the three approaches.

Thank you,

Christopher S. McGranahan, PE, PTOE

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
A	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
B	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. The delay could be up to 15 seconds. Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
C	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.
D	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
E	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. There is a high probability that this intersection will meet traffic signal warrants. The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
F	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. The only remedy for these long delays is installing a traffic signal or restricting the accesses. The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.

Intersection Summary

Cycle Length: 120

Actuated Cycle Length: 103

Natural Cycle: 70

Control Type: Semi Act-Uncoord

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 27.0

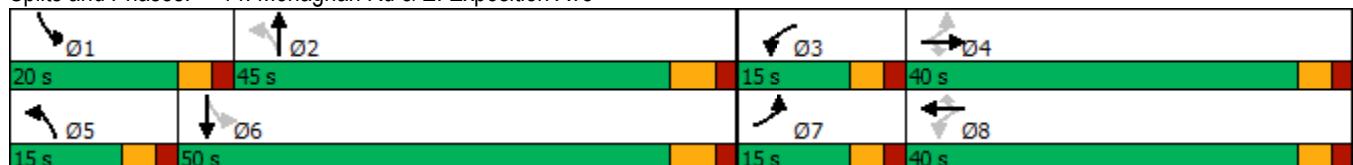

Intersection LOS: C

Intersection Capacity Utilization 61.9%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 14: Monaghan Rd & E. Exposition Ave

Queues
