Littleton, CO 80127

Re: E-470 and 6th Pkwy FDP
Aurora, CO
LSC #180221

Dear Mr. Spehalski:

In response to your request, LSC Transportation Consultants, Inc. has prepared this updated traffic impact analysis for the proposed E-470 and 6th Pkwy FDP development to address City comments. As shown on Figure 1, the site is located south of E. 6th Parkway and west of N. Gun Club Road in Aurora, Colorado.

REPORT CONTENTS

The report contains the following: the existing roadway and traffic conditions in the vicinity of the site including the lane geometries, traffic controls, posted speed limits, etc.; the existing weekday peak-hour traffic volumes; the existing daily traffic volumes in the area; the typical weekday site-generated traffic volume projections for the site; the assignment of the projected traffic volumes to the area roadways; the projected short-term and long-term background and resulting total traffic volumes on the area roadways; the site's projected traffic impacts; and any recommended roadway improvements to mitigate the site's traffic impacts.

LAND USE AND ACCESS

The site is proposed to include a mix of uses. Phase 1 is proposed as a mix of townhomes and commercial uses with full movement and right-in/right-out access to N. Gun Club Road and right-in/right-out access to E. 6th Parkway. Figure 2a shows the conceptual site plan. Figure 2b shows the internal circulation plan and traffic control.

PEDESTRIAN CONNECTIVITY

The site plan shows the applicant will connect sidewalks between the proposed uses and the E. 6th Parkway/N. Gun Club Road intersection where existing sidewalks connect to the residential areas east of N. Gun Club Road. E. Ellsworth Avenue is a rural roadway with no existing sidewalks so no pedestrian connections are proposed at this location.

ROADWAY AND TRAFFIC CONDITIONS

Area Roadways

The major roadways in the site's vicinity are shown on Figure 1 and are described below.

- **E. 6th Parkway** is an east-west, two-lane arterial roadway north of the site. The intersection with N. Gun Club Road is signalized with auxiliary turn lanes. The posted speed limit in the vicinity of the site is 45 mph. The City of Aurora *Northeast Aurora Transportation Study* (NEATS) shows this roadway as a six-lane arterial in the long term so it is assumed to be six lanes by 2040.
- **N. Gun Club Road** is a north-south, two-lane arterial roadway east of the site. The intersection with E. 6th Parkway is signalized with auxiliary turn lanes. The posted speed limit is 45 mph in the vicinity of the site. The NEATS shows a four-lane arterial in the long term so it is assumed to be four lanes by 2040.
- **E. Ellsworth Avenue** is an east-west local street, connecting N. Gun Club Road with E. Alameda Avenue. It provides access to a large-lot residential subdivision. It is assumed to remain two lanes through 2040.
- **E. Alameda Avenue** is an east-west roadway southeast of the site. It is planned as a four-lane minor arterial east of E. Gun Club Road. The posted speed limit east of N. Gun Club Road is 35 mph. The intersection with E. Gun Club Road will have traffic signal control over time.

Existing Traffic Conditions

Figure 3 shows the existing lane geometries, traffic controls, posted speed limits and traffic volumes in the site's vicinity on a typical weekday. The weekday peak-hour traffic volumes at Intersection #1 are based on Figure 3 of the *Cross Creek MTIA* by SM Rocha, LLC grown for one year at an annual rate of three percent. The through movements at Intersection #5 were balanced with Intersection #1. The daily volumes were updated based on ten times the afternoon peak-hour volumes.

2025 and 2040 Background Traffic

Figures 4a and 5a show the estimated 2025 and 2040 background traffic. The 2025 background traffic is based on a three percent annual growth rate plus the trip assignment from Figure 9 of the *Cross Creek MTIA* by SM Rocha, LLC and from Figure 8 of the *Lamar Landing TIA* by Kimley-Horn. The 2040 background traffic is based on the 2025 background traffic grown at an annual rate of two percent. Figures 4b and 5b show the 2025 and 2040 lane geometry and traffic control.

Existing, 2025, and 2040 Background Levels of Service

Level of service (LOS) is a quantitative measure of the level of congestion or delay at an intersection. Level of service is indicated on a scale from "A" to "F." LOS A is indicative of little con-

gestion or delay and LOS F is indicative of a high level of congestion or delay. Attached are specific level of service definitions for signalized and unsignalized intersections.

The intersections in Figures 3, 4a, and 5a were analyzed to determine the existing, 2025, and 2040 background levels of service using Synchro. Table 1 shows the level of service analysis results. The level of service reports are attached.

1. **E. 6th Parkway/N. Gun Club Road:** This signalized intersection is expected to operate at an overall LOS "D" or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.
2. **E. 6th Parkway/E-470 SB Ramps:** By 2025, this intersection is expected to operate poorly and require traffic signal control. It is expected to be signalized by others by 2040 and as such is expected to operate at an overall LOS "B" during both peak-hours with the recommended improvements.
3. **E. 6th Parkway/E-470 NB Ramp:** By 2025, this intersection is expected to operate poorly and require traffic signal control. It is expected to be signalized by others by 2040 and as such is expected to operate at an overall LOS "C" or better during both peak-hours with the recommended improvements.
4. **N. Gun Club Road/E. Ellsworth Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS "C" or better during both morning and afternoon peak-hours through 2040 with the following exception: The westbound approach is expected to operate at LOS "E" or "F" during one or both peak-hours prior to traffic signal control.
5. **N. Gun Club Road/E. Alameda Avenue:** All movements at this stop-sign controlled intersection currently operate at LOS "A" during both morning and afternoon peak-hours and are expected to do so through 2040 with the following exception: The westbound approach currently operates at LOS "F" during both morning and afternoon peak-hours and is expected to do so in the future. Operations will likely improve once N. Gun Club Road is widened to four lanes. This intersection will likely require turn lanes and traffic signal control in the future by others to prevent traffic from westbound E. Alameda Avenue diverting north from E. Alameda Avenue along S. Coolidge Street and E. Ellsworth Avenue to access N. Gun Club Road at the proposed traffic signal at N. Gun Club Road/E. Ellsworth Avenue (#4).

TRIP GENERATION

Table 2a shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the proposed Phase 1 land use based on the rates from *Trip Generation, 11th Edition, 2021* by the Institute of Transportation Engineers (ITE).

Phase 1 of the site is expected to generate about 3,667 external vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 425 vehicles would enter and about 408 vehicles would exit the site. During the afternoon peak-

hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 320 vehicles would enter and about 314 vehicles would exit.

Table 2b shows the estimated average weekday, morning peak-hour, and afternoon peak-hour trip generation for the buildout land use scenario based on the rates from *Trip Generation, 11th Edition, 2021* by the Institute of Transportation Engineers (ITE).

The buildout of the site is expected to generate about 16,113 external vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, which generally occurs for one hour between 6:30 and 8:30 a.m., about 1,081 vehicles would enter and about 983 vehicles would exit the site. During the afternoon peak-hour, which generally occurs for one hour between 4:00 and 6:00 p.m., about 1,223 vehicles would enter and about 1,190 vehicles would exit.

Tables 2a and 2b also show the portion of site-generated trips expected to be pass-by trips.

DIRECTIONAL DISTRIBUTION

Figure 6 shows the estimated directional distribution of the primary site-generated traffic volumes on the area roadways. The estimates were based on the location of the site with respect to the regional population, employment, and activity centers; and the site's proposed land use.

TRIP ASSIGNMENT

Figure 7a shows the estimated assignment of Phase 1 primary site-generated traffic volumes based on the primary trip generation estimate (from Table 2a) and the directional distribution shown in Figure 6.

Figure 7b shows the estimated assignment of Phase 1 pass-by site-generated traffic volumes.

Figure 7c shows the Phase 1 total site-generated traffic volumes which is the sum of the volumes in Figures 7a and 7b.

Figure 8a shows the estimated assignment of primary buildout site-generated traffic volumes based on the primary trip generation estimate (from Table 2b) and the directional distribution shown in Figure 6.

Figure 8b shows the estimated assignment of buildout passby site-generated traffic volumes.

Figure 8c shows the total buildout site-generated traffic volumes which is the sum of the volumes in Figures 8a and 8b.

2025 AND 2040 TOTAL TRAFFIC

Figure 9a shows the estimated Phase 1 2025 total traffic which is the sum of the 2025 background traffic volumes (from Figure 4a) and the Phase 1 site-generated traffic volumes (from Figure 7c). Figure 9b shows the recommended Phase 1 2025 lane geometry and traffic control.

Figure 10a shows the estimated buildout 2040 total traffic which is the sum of the 2040 background traffic volumes (from Figure 5a) and the buildout site-generated traffic volumes (from Figure 8c). Figure 10b shows the recommended 2040 lane geometry and traffic control.

PROJECTED LEVELS OF SERVICE

The intersections in Figures 9a through 10b were analyzed to determine the 2025 and 2040 total levels of service. Table 1 shows the level of service analysis results. The level of service reports are attached.

1. **E. 6th Parkway/N. Gun Club Road:** This signalized intersection is expected to operate at an overall LOS “D” during both morning and afternoon peak-hours through 2040 with the recommended improvements.
2. **E. 6th Parkway/E-470 SB Ramps:** This intersection is expected to be signalized by 2040 and as such is expected to operate at an overall “B” during both morning and afternoon peak-hours with the recommended improvements.
3. **E. 6th Parkway/E-470 NB Ramps:** This intersection is expected to be signalized by 2040 and as such is expected to operate at an overall LOS “C” or better in both peak-hours with the recommended improvements.
4. **N. Gun Club Road/E. Ellsworth Avenue/Site Access:** This intersection is expected to be signalized by 2025 and as such is expected to operate at an overall “C” or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.
5. **N. Gun Club Road/E. Alameda Avenue:** All movements at this stop-sign controlled intersection are expected to operate at LOS “B” or better during both morning and afternoon peak-hours through 2040 with the following exception: The westbound approach is expected to operate at LOS “F” during both peak-hours through 2025. Operations will likely improve once N. Gun Club Road is widened to four lanes. This intersection will likely require turn lanes and traffic signal control in the future by others to prevent traffic from westbound E. Alameda Avenue diverting north from E. Alameda Avenue along S. Coolidge Street and E. Ellsworth Avenue to access N. Gun Club Road at the proposed traffic signal at N. Gun Club Road/E. Ellsworth Avenue (#4). As a signalized intersection, it is expected to operate at an overall LOS “B” or better during both morning and afternoon peak-hours through 2040.
6. **E. 6th Parkway/RIRO Site Access:** All movements at this unsignalized intersection are expected to operate at LOS “C” or better through 2040.
7. **N. Gun Club Road/RIRO Site Access:** All movements at this unsignalized intersection are expected to operate at LOS “D” or better through 2040.

TRAFFIC SIGNAL WARRANT ANALYSIS

Figures 11 and 12 show the intersections of N. Gun Club Road/E. Ellsworth Avenue (#4) and N. Gun Club Road/E. Alameda Avenue (#5) are expected to clearly meet a four-hour traffic signal warrant by 2025. The proposed traffic signal at Intersection #4 will be constructed by the applicant and at Intersection #5 will be constructed by others.

The peak- and eight-hour warrants are also expected to be met at Intersection #4 due to the commercial nature of the site. The peak-hour threshold of 75 vph will be exceeded and the eight-hour threshold of 53 vph will likely be exceeded for eight hours. It would be appropriate to check for traffic signal warrants at each site development phase.

95TH PERCENTILE QUEUE LENGTH

The estimated 95th percentile queue lengths for the signalized intersections are shown in Table 3 along with the existing and recommended turn lane lengths.

RECOMMENDED IMPROVEMENTS

The recommended improvements are shown in Figures 9b and 10b and are detailed in Tables 3 and 4.

CONCLUSIONS AND RECOMMENDATIONS

Trip Generation

1. Phase 1 of the site is expected to generate about 3,667 external vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, about 425 vehicles would enter and about 408 vehicles would exit the site. During the afternoon peak-hour, about 320 vehicles would enter and about 314 vehicles would exit.
2. The buildout of the site is expected to generate about 16,113 external vehicle-trips on the average weekday, with about half entering and half exiting during a 24-hour period. During the morning peak-hour, about 1,081 vehicles would enter and about 983 vehicles would exit the site. During the afternoon peak-hour, about 1,223 vehicles would enter and about 1,190 vehicles would exit.

Projected Levels of Service

3. All of the signalized intersections analyzed are expected to operate at LOS "D" or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.
4. All movements at the unsignalized intersections analyzed are expected to operate at LOS "D" or better during both morning and afternoon peak-hours through 2040 with the recommended improvements.

Conclusions

5. The impact of the site can be accommodated by the existing and planned roadway improvements with the following recommended improvements.

Recommendations

6. The interim improvements recommended for Phase 1 in 2025 are shown in Figure 9b and Table 3 and detailed in Table 4. The recommended 2040 improvements are shown in Figure 10b and Table 3 and are detailed in Table 4.

				EB Through - 3 through lanes	Others
				WB Through = 3 through lanes	Others
#3	E. 6th Parkway/E-470 NB Ramps	Traffic Signal Control when warranted	Others	EB Through - 3 through lanes	Others
				WB Through = 3 through lanes	Others
				NB to EB Accel Lane - Continuous Lane to #6	Others
				NB RT = Lengthen from 130 feet to 250 feet	Others

(1) An appropriate redirect taper for 45 mph is 45:1; for 40 mph is 30:1, and for 25 mph is 15:1

(2) An appropriate transition taper for 45 mph is 13.5:1, for 40 mph is 12:1, and for 25 mph is 7.5:1

(3) Some of the right-turn deceleration and acceleration lane termini are close enough that a continuous right-turn lane may be appropriate between intersections.

(4) Turn lanes are based on the CDOT NR-B classification which requires deceleration lanes for posted speed limits above 40 mph.

Table 4 (Page 2 of 2)
Recommended Improvements to Public Street Network
E-470 & 6th Parkway
Aurora, CO
LSC #180221; December, 2022

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

SIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

<u>LOS</u>	<u>Average Vehicle Delay</u> sec/vehicle	<u>Operational Characteristics</u>
A	<10 seconds	Describes operations with low control delay, up to 10 sec/veh. This LOS occurs when progression is extremely favorable and most vehicles arrive during the green phase. Many vehicles do not stop at all. Short cycle lengths may tend to contribute to low delay values.
B	10 to 20 seconds	Describes operations with control delay greater than 10 seconds and up to 20 sec/veh. This level generally occurs with good progression, short cycle lengths, or both. More vehicles stop than with LOS A, causing higher levels of delay.
C	20 to 35 seconds	Describes operations with control delay greater than 20 and up to 35 sec/veh. These higher delays may result from only fair progression, longer cycle length, or both. Individual cycle failures may begin to appear at this level. Cycle failure occurs when a given green phase does not serve queued vehicles, and overflows occur. The number of vehicles stopping is significant at this level, though many still pass through the intersection without stopping.
D	35 to 55 seconds	Describes operations with control delay greater than 35 and up to 55 sec/veh. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and high v/c ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	55 to 80 seconds	Describes operations with control delay greater than 55 and up to 80 sec/veh. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent.
F	>80 seconds	Describes operations with control delay in excess of 80 sec/veh. This level, considered unacceptable to most drivers, often occurs with over-saturation, that is, when arrival flow rates exceed the capacity of lane groups. It may also occur at high v/c ratios with many individual cycle failures. Poor progression and long cycle lengths may also contribute significantly to high delay levels.

LEVEL OF SERVICE DEFINITIONS

From *Highway Capacity Manual, Transportation Research Board, 2016, 6th Edition*

UNSIGNALIZED INTERSECTION LEVEL OF SERVICE (LOS)

Applicable to Two-Way Stop Control, All-Way Stop Control, and Roundabouts

LOS	Average Vehicle Control Delay	Operational Characteristics
A	<10 seconds	Normally, vehicles on the stop-controlled approach only have to wait up to 10 seconds before being able to clear the intersection. Left-turning vehicles on the uncontrolled street do not have to wait to make their turn.
B	10 to 15 seconds	Vehicles on the stop-controlled approach will experience delays before being able to clear the intersection. The delay could be up to 15 seconds. Left-turning vehicles on the uncontrolled street may have to wait to make their turn.
C	15 to 25 seconds	Vehicles on the stop-controlled approach can expect delays in the range of 15 to 25 seconds before clearing the intersection. Motorists may begin to take chances due to the long delays, thereby posing a safety risk to through traffic. Left-turning vehicles on the uncontrolled street will now be required to wait to make their turn causing a queue to be created in the turn lane.
D	25 to 35 seconds	This is the point at which a traffic signal may be warranted for this intersection. The delays for the stop-controlled intersection are not considered to be excessive. The length of the queue may begin to block other public and private access points.
E	35 to 50 seconds	The delays for all critical traffic movements are considered to be unacceptable. The length of the queues for the stop-controlled approaches as well as the left-turn movements are extremely long. There is a high probability that this intersection will meet traffic signal warrants. The ability to install a traffic signal is affected by the location of other existing traffic signals. Consideration may be given to restricting the accesses by eliminating the left-turn movements from and to the stop-controlled approach.
F	>50 seconds	The delay for the critical traffic movements are probably in excess of 100 seconds. The length of the queues are extremely long. Motorists are selecting alternative routes due to the long delays. The only remedy for these long delays is installing a traffic signal or restricting the accesses. The potential for accidents at this intersection are extremely high due to motorist taking more risky chances. If the median permits, motorists begin making two-stage left-turns.
